Volume 3: Nonresidential Measures

Volume 2: Residential Measures

2.1 Appliances

2.1.1 Clothes Washer

DESCRIPTION

This measure relates to the installation of a clothes washer meeting the ENERGY STAR or CEE Tier 2 minimum qualifications. Note if the domestic hot water (DHW) and dryer fuels of the installations are unknown (for example through a retail program) savings are based on a weighted blend using RECS data (the resultant values (kWh, therms and gallons of water) are provided). The algorithms can also be used to calculate site specific savings where DHW and dryer fuels are known.

This measure was developed to be applicable to the following program types: TOS, NC.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

Clothes washer must meet the ENERGY STAR or CEE Tier 2 minimum qualifications (provided in the table below), as required by the program.

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is a standard-sized clothes washer meeting the minimum federal baseline as of January 2018.¹

Efficiency Level		Top Loading >2.5 Cu ft	Front Loading >2.5 Cu ft
Baseline Federal Standard		≥1.57 IMEF, ≤6.5 IWF	≥1.84 IMEF, ≤4.7 IWF
	ENERGY STAR	≥2.06 IMEF, ≤4.3 IWF	≥2.76 IMEF, ≤3.2 IWF
Efficient	Efficient	T Tior 2	≥2.92 IMEF,
		E Tier 2	≤3.2 IWF

The Integrated Modified Energy Factor (IMEF) includes unit operation, standby, water heating, and drying energy use, with the higher the value the more efficient the unit; "The quotient of the cubic foot (or liter) capacity of the clothes container divided by the total clothes washer energy consumption per cycle, with such energy consumption expressed as the sum of the machine electrical energy consumption, the hot water energy consumption, the energy required for removal of the remaining moisture in the wash load, and the combined low-power mode energy consumption."

The Integrated Water Factor (IWF) indicates the total water consumption of the unit, with the lower the value the less water required; *"The quotient of the total weighted per-cycle water consumption for all 67 wash cycles in gallons divided by the cubic foot (or liter) capacity of the clothes washer."*²

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 14 years.³

¹ See http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/39.

² Definitions provided in ENERGY STAR v8.0 specification on the ENERGY STAR website.

³ Based on DOE Chapter 8 Life-Cycle Cost and Payback Period Analysis.

Iowa Energy Efficiency Statewide Technical Reference Manual-2.1.1 Clothes Washer

DEEMED MEASURE COST

The incremental cost assumptions are provided below:⁴

Efficiency Level	Incremental Cost		Incremental Cost	
	Top Loading	Front Loading		
ENERGY STAR	\$73	\$121		
CEE TIER 2	\$193	\$141		

LOADSHAPE

Loadshape RE14 – Residential Clothes Washer

Loadshape G03 – Residential Dryer

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

$$\Delta kWh = \left[\left(Capacity * \frac{1}{IMEFbase} * Ncycles \right) * \left(\%CWbase + (\%DHWbase * \%Electric_{DHW}) + (\%Dryerbase * \%Electric_{Dryer}) \right) \right] - \left[\left(Capacity * \frac{1}{IMEFeff} * Ncycles \right) * \left(\%CWeff + (\%DHWeff * \%Electric_{DHW}) + (\%Dryereff * \%Electric_{Dryer}) \right) \right]$$

Where:

Capacity = Clothes Washer capacity (cubic feet)

= Actual – If capacity is unknown, assume 3.93 cubic feet ⁵

IMEFbase

= Integrated Modified Energy Factor of baseline unit

	IMEFbase			
Efficiency Level	Top loading Front Loading		Weighted	
	>2.5 Cu ft	>2.5 Cu ft	Average ⁶	
Federal Standard	1.57	1.84	1.84	

IMEFeff = Integrated Modified Energy Factor of efficient unit

⁶ Weighted average IMEF of Federal Standard rating for Front Loading and Top Loading units. Weighting is based upon the relative top v front loading percentage of available non-ENERGY STAR product in the CEC database (accessed 04/16/2017). The relative weightings are as follows, see more information in "2017 Clothes Washer Analysis.xlsx":

Efficiency Level	Front	Тор
Baseline	98%	2%
ENERGY STAR	27%	73%
CEE Tier 2	100%	0%

⁴ Based on cost data from Life-Cycle Cost and Payback Period Excel-based analytical tool. See '2017 Clothes Washer Analysis.xls' for details.

⁵ Based on the average clothes washer volume of all units that pass the new Federal Standard and have an IMEF value on the CEC database of Clothes Washer products (accessed on 04/16/2017). If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area, then they should be used.

%Electric_{Dryer}

= Percentage of dryer savings assumed to be electric

Dryer fuel	%Electric _{Dryer}
Electric	100%
Natural Gas	0%

⁷ Weighting is based upon the relative top v front loading percentage of available product in the CEC database (accessed 04/16/2017).

⁸ Weighted average of 250 clothes washer cycles per year (based on 2015 Residential Energy Consumption Survey (RECS) national sample survey of housing appliances section, Midwest Census Region, West North Central Census Division: <u>https://www.eia.gov/consumption/residential/data/2015/</u>.See '2017 Clothes Washer Analysis.xls' for details.

If utilities have specific evaluation results providing a more appropriate assumption for single-family or multi-family homes, in a particular market, or geographical area then that should be used.

⁹ The percentage of total energy consumption that is used for the machine, heating the hot water, or by the dryer is different depending on the efficiency of the unit. Values are based on a weighted average of top loading and front loading units based on data from DOE Life-Cycle Cost and Payback Analysis. See '2017 Clothes Washer Analysis.xls' for details.

¹⁰ Default assumption for unknown fuel is based on Dunsky and Opinion Dynamics Baseline Study. If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area, then they should be used

Iowa Energy Efficiency Statewide Technical Reference Manual-2.1.1 Clothes Washer

Dryer fuel	%Electric _{Dryer}
Unknown	87.1% ¹¹

Using the default assumptions provided above, the prescriptive savings for each configuration are presented below:¹²

Front Loaders:

	ΔkWH			
	Electric DHW Electric Dryer	Gas DHW Electric Dryer	Electric DHW Gas Dryer	Gas DHW Gas Dryer
ENERGY STAR	179.3	97.6	84.8	3.1
CEE Tier 2	198.8	115.3	89.4	5.8

Top Loaders:

	ΔkWH			
	Electric DHW Gas DHW Electric DHW Gas DHW			
	Electric Dryer	Electric Dryer	Gas Dryer	Gas Dryer
ENERGY STAR	58.4	81.0	9.6	32.2
CEE Tier 2	198.8	180.6	56.4	38.2

Weighted Average:

	ΔkWH			
	Electric DHW Gas DHW Electric DHW Gas DHW			
	Electric Dryer	Electric Dryer	Gas Dryer	Gas Dryer
ENERGY STAR	98.0	86.4	34.3	22.7
CEE Tier 2	198.8	115.3	89.4	5.8

If the DHW and dryer fuel is unknown the prescriptive kWH savings based on defaults provided above should be:

	ΔkWH		
Efficiency Level	Front Loaders	Top Loaders	Weighted Average
ENERGY STAR	110.0	67.9	81.7
CEE Tier 2	126.3	167.8	126.3

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \frac{\Delta kWh}{Hours} * CF$$

Where:

¹¹ Default assumption for unknown is based on percentage of homes with clothes washers that use an electric dryer from EIA Residential Energy Consumption Survey (RECS) 2015 for Midwest Region, West North Central Census Division If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area, then they should be used.

¹² Note that the baseline savings for all cases (Front, Top and Weighted Average) is based on the weighted average baseline IMEF (as opposed to assuming Front baseline for Front efficient unit and Top baseline for Top efficient unit). The reasoning is that the support of the program of more efficient units (which are predominately front loading) will result in some participants switching from planned purchase of a top loader to a front loader.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.1.1 Clothes Washer

ΔkWh	= Energy Savings as calculated above
Hours	= Assumed Run hours of Clothes Washer
	= 250 hours ¹³
CF	= Summer Peak Coincidence Factor for measure
	= 0.036 ¹⁴

Using the default assumptions provided above, the prescriptive savings for each configuration are presented below: Front Loaders:

	ΔkW			
	Electric DHW	Gas DHW	Electric DHW	Gas DHW
	Electric Dryer	Electric Dryer	Gas Dryer	Gas Dryer
ENERGY STAR	0.0258	0.0141	0.0122	0.0005
CEE Tier 2	0.0286	0.0166	0.0129	0.0008

Top Loaders:

	ΔkW			
	Electric DHW Gas DHW Electric DHW Gas DHW			Gas DHW
	Electric Dryer	Electric Dryer	Gas Dryer	Gas Dryer
ENERGY STAR	0.0084	0.0117	0.0014	0.0046
CEE Tier 2	0.0286	0.0260	0.0081	0.0055

Weighted Average:

	ΔkW			
	Electric DHW Gas DHW Electric DHW Gas DHW			Gas DHW
	Electric Dryer	Electric Dryer	Gas Dryer	Gas Dryer
ENERGY STAR	0.0141	0.0124	0.0049	0.0033
CEE Tier 2	0.0286	0.0166	0.0129	0.0008

If the DHW and dryer fuel is unknown, the prescriptive kW savings should be:

	ΔkW			
Efficiency Level	Front Loaders	Top Loaders	Weighted Average	
ENERGY STAR	0.0158	0.0098	0.0118	
CEE Tier 2	0.0182	0.0241	0.0182	

¹³ Based on a weighted average of 250 clothes washer cycles per year assuming an average load runs for one hour.

¹⁴ Calculated from Itron eShapes, 8760 hourly data by end use for Missouri, using IA definition of summer peak period.

Iowa Energy Efficiency Statewide Technical Reference Manual -2.1.1 Clothes Washer

NATURAL GAS SAVINGS

$$\Delta Therms = \left[\left[\left(Capacity * \frac{1}{IMEFbase} * Ncycles \right) * \left((\%DHWbase * \%Natural Gas_{DHW} * R_eff \right) + \left(\%Dryerbase * \%Gas_{Dryer} \%Gas _Dryer \right) \right] - \left[\left(Capacity * \frac{1}{IMEFeff} * Ncycles \right) * \left((\%DHWeff * \%Gas_{DHW} \%Natural Gas_DHW * R_eff) + (\%Dryereff * \%Gas_{Dryer} \%Gas_Dryer) \right) \right] * Therm_convert$$

Where:

%Gas_{DHw}

= Percentage of DHW savings assumed to be Natural Gas

DHW fuel	%Gas _{DHw}
Electric	0%
Natural Gas	100%
Unknown	70.0% ¹⁵

R eff

= Recovery efficiency factor

= 1.26¹⁶

%Gas_{Dryer}

= Percentage of dryer savings assumed to be Natural Gas

Dryer fuel	%Gas _{Dryer}
Electric	0%
Natural Gas	100%
Unknown	12.9% ¹⁷

Therm_convert = Conversion factor from kWh to Therm

= 0.03412

Other factors as defined above.

Using the default assumptions provided above, the prescriptive savings for each configuration are presented below: Front Loaders:

	ΔTherms			
	Electric DHW Gas DHW Electric DHW Gas DHW			
	Electric Dryer	Electric Dryer	Gas Dryer	Gas Dryer
ENERGY STAR	0.0	3.5	3.2	6.7
CEE Tier 2	0.0	3.6	3.7	7.3

¹⁵ Default assumption for unknown fuel is based on Dunsky and Opinion Dynamics Baseline Study results. If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area then that should be used.

¹⁶ To account for the different efficiency of electric and Natural Gas hot water heaters (gas water heater: recovery efficiencies ranging from 0.74 to 0.85 (0.78 used), and electric water heater with 0.98 recovery efficiency

^{(&}lt;u>http://www.energystar.gov/ia/partners/bldrs_lenders_raters/downloads/Waste_Water_Heat_Recovery_Guidelines.pdf</u>). Therefore a factor of 0.98/0.78 (1.26) is applied.

¹⁷ Default assumption for unknown fuel is based EIA Residential Energy Consumption Survey (RECS) 2015 for Midwest Region, West North Central Census Division. If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area then that should be used. Note that the electric dryer percentage (76%) plus the gas dryer percentage (21.2%) equals 97.2%. The remaining 2.8% accounts for those homes without dryers.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.1.1 Clothes Washer

Top Loaders:

	ΔTherms			
	Electric DHWGas DHWElectric DHWGas DHWElectric DryerElectric DryerGas DryerGas Dryer			
ENERGY STAR	0.0	-1.0	1.7	0.7
CEE Tier 2	0.0	0.8	4.9	5.6

Weighted Average:

ENERGY STAR	0.0	0.5	2.2	2.7		
CEE Tier 2	0.0	3.6	3.7	7.3		

If the DHW and dryer fuel is unknown, the prescriptive Therm savings should be:

	ΔTherms				
Efficiency Level	Front Loaders	Top Loaders	Weighted Average		
ENERGY STAR	2.9	-0.5	0.6		
CEE Tier 2	3.0	1.2	3.0		

PEAK GAS SAVINGS

Savings for this measure is assumed to be evenly spread across the year. The Peak Gas Savings is therefore assumed to be:

$$\Delta PeakTherms = \frac{\Delta Therms}{365.25}$$

Where:

ΔTherms = Therm impact calculated above

365.25 = Days per year

Using the default assumptions provided above, the prescriptive savings for each configuration are presented below:

Front Loaders:

	ΔPeakTherms				
	Electric DHW	Gas DHW	Electric DHW	Gas DHW	
	Electric Dryer	Electric Dryer	Gas Dryer	Gas Dryer

DEEMED O&M COST ADJUSTMENT CALCULATION

N/A

MEASURE CODE: RS-APL-CLWA-V04-200101

SUNSET DATE: 1/1/2023

¹⁸ Weighted average IWF of Federal Standard rating for Front Loading and Top Loading units. Weighting is based upon the relative top v front loading percentage of available non-ENERGY STAR product in the CEC database.

¹⁹ IWF values are the weighted average of the new ENERGY STAR specifications. Weighting is based upon the relative top v front loading percentage of available ENERGY STAR and ENERGY STAR Most Efficient product in the CEC database. See "2017 Clothes Washer Analysis.xls" for the calculation.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.1.2 Clothes Dryer

2.1.2 Clothes Dryer

DESCRIPTION

This measure relates to the installation of a residential clothes dryer meeting the ENERGY STAR, ENERGY STAR Most Efficient criteria or a full heat pump clothes dryer. ENERGY STAR qualified clothes dryers save energy through a combination of more efficient drying and reduced runtime of the drying cycle. More efficient drying is achieved through increased insulation, modifying operating conditions such as air flow and/or heat input rate, improving air circulation through better drum design or booster fans, and improving efficiency of motors. Reducing the runtime of dryers through automatic termination by temperature and moisture sensors is believed to have the greatest potential for reducing energy use in clothes dryers.²⁰ ENERGY STAR provides criteria for both gas and electric clothes dryers.

This measure was developed to be applicable to the following program types: TOS, NC. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

Clothes dryer must meet the ENERGY STAR criteria, as required by the program.

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is a clothes dryer meeting the minimum federal requirements for units manufactured on or after January 1, 2015.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 16 years.²¹

DEEMED MEASURE COST

The incremental cost for an ENERGY STAR clothes dryer is assumed to be as follows:²²

Product Class	Incremental Cost
Vented Electric, Standard (\geq 4.4 ft ³)	\$61
Ventless Electric, Standard (≥ 4.4 ft ³)	\$61
Most Efficient Vented Hybrid, Standard	\$127
Most Efficient Ventless Hybrid, Standard	\$127
Full Heat Pump, Standard	\$412
Vented Electric, Compact (120V) (< 4.4 ft ³)	\$31
Ventless Electric, Compact (120V) (< 4.4 ft ³)	\$31
Vented Electric, Compact (240V) (< 4.4 ft ³)	\$90
Ventless Electric, Compact (240V) (< 4.4 ft ³)	\$90
Vented Gas	\$104
Most Efficient Vented Gas	\$158

COINCIDENCE FACTOR

The coincidence factor for this measure is 4.31%.²³

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

 $\Delta kWh = \left(\left(\frac{Load}{CEFbase} - \frac{Load}{CEFeff} \right) * Ncycles * \%Electric \right) - PairedWasherkWhAdj$ $+ \Delta kWhHEAT + \Delta kWhCOOL$

Where:

Load

= The average total weight (lbs) of clothes per drying cycle. If dryer size is unknown, assume standard.

Dryer Size	Load (lbs) ²⁴
Standard	8.45
Compact	3

CEFbase = Combined energy factor (CEF) (lbs/kWh) of the baseline unit is based on existing federal standards energy factor and adjusted to CEF as performed in the ENERGY STAR analysis.²⁵ If product class unknown, assume electric, standard.

Product Class	CEFbase (lbs/kWh)
Vented Electric, Standard (\geq 4.4 ft ³)	3.11
Vented Electric, Compact (120V) (< 4.4 ft ³)	3.01
Vented Electric, Compact (240V) (<4.4 ft ³)	2.73
Ventless Electric, Compact (240V) (<4.4 ft ³)	2.13
Vented Gas	2.84 ²⁶

CEFeff

= CEF (lbs/kWh) of the ENERGY STAR unit based on ENERGY STAR requirements.²⁷ If product class unknown, assume electric, standard.

Product Class	CEFeff (lbs/kWh)
Vented Electric, Standard (≥ 4.4 ft ³)	3.93
Ventless Electric, Standard (≥ 4.4 ft ³)	3.93
Most Efficient Vented Hybrid, Standard	4.30
Most Efficient Ventless Hybrid, Standard	4.30

²³ Developed using coincident peak information from March 2015 NEEP, "Residential Electric Clothes Dryer Baseline Study" conducted by Energy Resource

Solutions.<u>https://neep.org/sites/default/files/resources/NEEP_EMV_Summary%20Report_Dryer%20Baseline%20Finale%204-01-15.pdf</u>

 $^{^{\}rm 25}$ ENERGY STAR Draft 2 Version 1.0 Clothes Dryers Data and Analysis

²⁶ Federal standards report CEF for gas clothes dryers in terms of lbs/kWh. To determine gas savings, this number is later converted to therms.

²⁷ ENERGY STAR Clothes Dryers Key Product Criteria.

https://www.energystar.gov/index.cfm?c=clothesdry.pr crit clothes dryers

Iowa Energy Efficiency Statewide Technical Reference Manual -2.1.2 Clothes Dryer

Product Class	CEFeff (lbs/kWh)
Full Heat Pump, Standard	10.40 ²⁸
Vented Electric, Compact (120V) (< 4.4 ft ³)	3.80
Ventless Electric, Compact (120V) (< 4.4 ft ³)	3.80
Vented Electric, Compact (240V) (< 4.4 ft ³)	3.45
Ventless Electric, Compact (240V) (< 4.4 ft ³)	2.68
Vented Gas	3.48 ²⁹
Most Efficient Vented Gas	3.80

Ncycles = Number of dryer cycles per year. Use actual data if available. If unknown, use 250 cycles per year.³⁰

%Electric = The percent of overall savings coming from electricity

= 100% for electric dryers, 16% for gas dryers³¹

PairedWasherkWhAdj = Adjustment to account for new clothes dryers often being purchased paired with an ENERGY STAR clothes washer (from which dryer savings are being claimed)³²

Product Class	PairedWasherAdj (kWh)
Vented Electric, Standard (≥ 4.4 ft ³)	44.6
Ventless Electric, Standard (≥ 4.4 ft ³)	44.6
Most Efficient Vented Hybrid, Standard	44.6
Most Efficient Ventless Hybrid, Standard	44.6
Full Heat Pump, Standard	44.6
Vented Electric, Compact (120V) (< 4.4 ft ³)	0
Ventless Electric, Compact (120V) (< 4.4 ft ³)	0
Vented Electric, Compact (240V) (< 4.4 ft ³)	0
Ventless Electric, Compact (240V) (< 4.4 ft ³)	0
Vented Gas	0
Most Efficient Vented Gas	0

ΔkWhHEAT = Electric space heating impact due to waste heat either being predominately vented to

http://www.energystar.gov/sites/default/files/specs//ENERGY%20STAR%20Dryer%20Specification%20NEEA%20Amended%20c omments%20Mar%2026%202013.pdf. Page 7.

²⁸ This represents the test results performed with 8.45 lb load (the standard test load size used by manufacturers for reporting performance), See 'Blomberg "Energy Star Partner Meeting – SEDI Session October 14, 2015." This is based upon single full heat pump models (Blomberg/Beko) available now in the US. This will be updated when additional equipment enters the market and/or when separate CEE/ESTAR specifications are released for Heat Pump Dryers.

²⁹ Federal standards report CEF for gas clothes dryers in terms of lbs/kWh. To determine gas savings, this number is later converted to therms.

³⁰ Weighted average of 250 clothes washer cycles per year, consistent with Clothes Washer measure and based on 2015 Residential Energy Consumption Survey (RECS) national sample survey of housing appliances section, Midwest Census Region, West North Central Census Division: <u>https://www.eia.gov/consumption/residential/data/2015/. See</u> RECS-Appliances tab in 'Clothes Dryer_Analysis_05082019.xlsx' for calculation.

If utilities have specific evaluation results providing a more appropriate assumption for single-family or multi-family homes, in a particular market, or geographical area then that should be used.

³¹ %Electric accounts for the fact that some of the savings on gas dryers comes from electricity (motors, controls, etc). 16% was determined using a ratio of the electric to total savings from gas dryers given by ENERGY STAR Draft 2 Version 1.0 Clothes Dryers Data and Analysis. <u>See</u> ENERGY STAR Analysis tab in 'Clothes Dryer_Analysis_05082019.xlsx' for calculation.

³² Dryer savings are calculated within the Clothes Washer measure. See "Clothes Dryer Calcs_04262017.xls" for more detail.

³⁵ Based on Dunsky and Opinion Dynamics Baseline Study results.

³⁴ Based on 217 days where HDD 60>0, divided by 365.25.

³⁶ NEEP Study found 16 of 22 sites had the dryer in a heated space; NEEP, Energy & Resource Solutions "Electric Dryer Baseline Research", p8.

http://www.neep.org/sites/default/files/Microsoft%20PowerPoint%20-%20NEEP%20Dryer%20Presentation%20Final%2003-30-15.pdf

³⁷ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Heat Pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.1.2 Clothes Dryer

System Type	Age of Equipment	HSPF Estimate	ηHeat (Effective COP Estimate) (HSPF/3.412)*0.85
Unknown	N/A	N/A	1.27 ³⁸

ΔkWhCOOL = Cooling impact due to waste heat either being predominately vented to outside or remaining in the home (ventless hybrid or heat pump)

= kWhCOOL_{Base} - kWhCOOL_{Eff}

kWhCOOL = (%HeatSpace * CoolF * %Cool * %Conditioned * Dryer Consumption) / nCool

Where:

- CoolF = Cooling Factor or percentage of reduced waste heat that no longer needs to be cooled
 - = 34% for unit in cooled space or unknown ³⁹
 - = 0% for unit in uncooled space

%Cool = Percentage of home with cooling

Home	%Cool
Cooling	100%
No Cooling	0%
Unknown	88% ⁴⁰

ηCool = Efficiency in COP of Cooling equipment

= Actual – If not available, assume 2.8 COP⁴¹

Using defaults provided above:

Product Class	CEF base	CEF eff	Base Dryer Consumpt ion (kWh)	Eff Dryer Consumption (kWH)	Paired Washer kWhAdj	kWh HEAT Base (kWh)	kWh HEAT Eff (kWh)	kWh COOL Base (kWh)	kWh COOL Eff (kWh)	Total Waste Heat Impact	ΔkWh
Vented Electric, Standard (≥ 4.4 ft ³)	3.11	3.93	679.5	537.7	44.6	2.0	1.6	2.7	2.1	0.1	97.3

https://neep.org/sites/default/files/resources/NEEP_EMV_Summary%20Report_Dryer%20Baseline%20Finale%204-01-15.pdf 43 Developed using coincident peak information from March 2015 NEEP, "Residential Electric Clothes Dryer Baseline Study" conducted by Energy Resource Solutions.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.1.2 Clothes Dryer

NATURAL GAS ENERGY SAVINGS

NATURAL GAS SAVINGS

Natural gas savings only apply to ENERGY STAR vented gas clothes dryers.

$$\Delta Therm = \left(\left(\frac{Load}{CEFbase} - \frac{Load}{CEFeff} \right) * Ncycles * Therm_{convert} * \%Gas \right)$$
$$- PairedWasherThermAdj + \Delta ThermHEAT$$

Where:

Therm_convert = Conversion factor from kWh to Therm

= 0.03412

%Gas = Percent of overall savings coming from gas

= 0% for electric units and 84% for gas units⁴⁴

PairedWasherThermAdj = Adjustment to account for new clothes dryers being purchased paired with an ENERGY STAR clothes washer (from which some dryer savings are already being claimed)

Product Class	PairedWasherAdj (Therm)
Vented Electric, Standard (\geq 4.4 ft ³)	0
Ventless Electric, Standard (≥ 4.4 ft ³)	0
Most Efficient Vented Hybrid, Standard	0
Most Efficient Ventless Hybrid, Standard	0
Full Heat Pump, Standard	0
Vented Electric, Compact (120V) (< 4.4 ft ³)	0
Ventless Electric, Compact (120V) (< 4.4 ft ³)	0
Vented Electric, Compact (240V) (< 4.4 ft ³)	0
Ventless Electric, Compact (240V) (< 4.4 ft ³)	0
Vented Gas	1.5
Most Efficient Vented Gas	1.5

ΔThermHEAT = Gas spaced heating impact due to waste heat either being predominately vented to outside or remaining in the home (ventless hybrid or heat pump)

= ThermHEATEff - ThermHEATBase

ThermHEAT = (%HeatSpace * HF * %GasHeat * %Conditioned * Dryer Consumption) / nHeat_{Gas}

Where:

%GasHeat = Percentage of homes with gas heat

Heating Fuel	%GasHeat
Electric	0%
Gas	100%
Unknown	83% ⁴⁵

⁴⁴ %Gas accounts for the fact that some of the savings on gas dryers comes from electricity (motors, controls, etc). 84% was determined using a ratio of the gas to total savings from gas dryers given by ENERGY STAR Draft 2 Version 1.0 Clothes Dryers Data and Analysis. See ENERGY STAR Analysis tab in 'Clothes Dryer_Analysis_05082019.xlsx' for calculation.
⁴⁵ Based on Dunsky and Opinion Dynamics Baseline Study results.

PEAK GAS SAVINGS

Savings for this measure is assumed to be evenly spread across the year. The Peak Gas Savings is therefore assumed to be:

$$\Delta PeakTherms = \frac{\Delta Therms}{365.25}$$

Where:

⁴⁶ This has been estimated assuming that natural gas central furnace heating is typical for Iowa residences (the predominant heating is gas furnace with 49% of Iowa homes - based on Energy Information Administration, 2009 Residential Energy Consumption Survey). In 2000, 60% of furnaces purchased in Iowa were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.60*0.92) + (0.40*0.8)) * (1-0.15) = 0.74.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.1.2 Clothes Dryer

ΔTherms = Therm impact calculated above

SUNSET DATE: 1/1/2023

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.1.3 Refrigerator

2.1.3 Refrigerator

DESCRIPTION

A refrigerator meeting either Energy Star/CEE Tier 1 specifications or the higher efficiency specifications of CEE Tier 2, or CEE Tier 3 is installed instead of a new unit of baseline efficiency. The measure applies to time of sale and early replacement programs.

This measure also includes a section accounting for the interactive effect of reduced waste heat on the heating and cooling loads.

This measure was developed to be applicable to the following program types: TOS, NC, EREP. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The high efficiency level is a refrigerator meeting Energy Star specifications effective September 15th, 2014 (10% above federal standard), a refrigerator meeting CEE Tier 2 specifications (15% above federal standard), or meeting CEE Tier 3 specifications (20% above federal standards).

DEFINITION OF BASELINE EQUIPMENT

Baseline efficiency is a new refrigerator meeting the minimum federal efficiency standard for refrigerators effective September 15th, 2014.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

17 years47

DEEMED MEASURE COST

The full cost of a baseline unit is \$803.48

The incremental cost to the Energy Star level is \$12, to CEE Tier 2 level is \$21 and to CEE Tier 3 is \$59.49

LOADSHAPE

Loadshape RE16 – Residential Refrigeration

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

$$\Delta kWh_{Unit} = kWh_{base} - (kWh_{base} * (1 - \%Savings))$$

Where:

⁴⁷ Mean from Figure 8.2.3, DOE, 2011-08-23 Technical Support Document for Energy Conservation Standards for Residential Refrigerators, Refrigerator-Freezers, and Freezers.

⁴⁸ Configurations weighted according to table under Energy Savings. Values inflated 13.2% (cumulative rate of inflation using government CPI data) from 2009 dollars to 2017. Table 8.1.1, DOE, 2011-08-23 Technical Support Document for Energy Conservation Standards for Residential Refrigerators, Refrigerator-Freezers, and Freezers. See 'Refrig Incremental Cost Calc. xls' for details.

⁴⁹ Configurations weighted according to table under Energy Savings. Values inflated 8.9% from 2009 dollars to 2015. Table 8.2.2, DOE, 2011-08-23 Technical Support Document for Energy Conservation Standards for Residential Refrigerators, Refrigerator-Freezers, and Freezers. See 'Refrig Incremental Cost Calc. xls' for details.

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.1.3 Refrigerator

kWh_{base}

= Baseline consumption

= Based on average consumption of non-ENERGY STAR units available in 4 main product classes. See tables below.⁵⁰

%Savings

= Specification of energy consumption below Federal Standard:

Tier	%Savings
Energy Star and CEE Tier 1	10%
Energy Star Most Efficient and CEE Tier 2	15%
CEE Tier 3	20%

Additional Waste Heat Impacts

For units in conditioned spaces in the home (if unknown, assume unit is in conditioned space).

$$\Delta kWh_{WasteHeat} = \Delta kWh * (WHFeHeatElectric + WHFeCool)$$

Where:

ΔkWh = kWh savings calculated from either method above

WHFeHeatElectric= Waste Heat Factor for Energy to account for electric heating increase from removing waste heat from refrigerator/freezer (if fossil fuel heating – see calculation of heating penalty in that section).

= - (HF / nHeat_{Electric}) * %ElecHeat

HF = Heating Factor or percentage of reduced waste heat that must now be heated

= 59% for unit in heated space or unknown ⁵¹

- = 0% for unit in unheated space
- ηHeat_{Electric} = Efficiency in COP of Heating equipment

= Actual system efficiency including duct loss – If not available, use:⁵²

System Type	Age of Equipment	HSPF Estimate	ηHeat (Effective COP Estimate) (HSPF/3.412)*0.85
	Before 2006	6.8	1.7
Heat Pump	2006 - 2014	7.7	1.92
	2015 on	8.2	2.04
Resistance	N/A	N/A	1
Unknown	N/A	N/A	1.27 ⁵³

⁵⁰ See 'Refrig_CAC database_04262017.XLS' for more information.

⁵¹ Based on 217 days where HDD 60>0, divided by 365.25.

⁵² These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Heat Pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

⁵³ Calculation assumes 33% Heat Pump and 67% Resistance, which is based upon data from Energy Information Administration, 2009 Residential Energy Consumption Survey, see "HC6.9 Space Heating in Midwest Region.xls". Average efficiency of heat pump is based on the assumption that 50% are units from before 2006 and 50% 2006-2014.

⁵⁸ Personal Communication from Melisa Fiffer, ENERGY STAR Appliance Program Manager, EPA 10/26/14

⁵⁹ Based on analysis of loadshape data provided by Cadmus.

 $^{^{60}}$ The value is estimated at 1.22 (calculated as 1 + (0.61 / 2.8)). See footnote relating to WHFe for details. Note the 61% factor represents the Residential cooling coincidence factor calculated using the average load during the peak period (as opposed to the peak hour), consistent with the lighting peak hours.

⁶¹ The value is estimated at 1.19 (calculated as 1 + (0.88 * 0.61 / 2.8)). See footnote relating to WHFe for details. Note the 61% factor represents the Residential cooling coincidence factor calculated using the average load during the peak period (as opposed to the peak hour), consistent with the lighting peak hours. The 88% is the percentage of homes have central cooling (based on Dunsky and Opinion Dynamics Baseline Study results).

⁶² Based on analysis of loadshape data provided by Cadmus.

Iowa Energy Efficiency Statewide Technical Reference Manual -2.1.3 Refrigerator

If product class is unknown, the following table provides a market weighting that is applied to give a single deemed savings for each efficiency level:

		∆kW				
Product Class	Market Weight ⁶³	Energy Star/ CEE Tier 1	CEE Tier 2	CEE Tier 3		
Top Freezer (PC 3)	52%		0.0113	0.0176

Default assumptions are provided below:

⁶³ Personal Communication from Melisa Fiffer, ENERGY STAR Appliance Program Manager, EPA 10/26/14

⁶⁴ Based on 217 days where HDD 60>0, divided by 365.25.

⁶⁵ This has been estimated assuming that natural gas central furnace heating is typical for Iowa residences (the predominant heating is gas furnace with 49% of Iowa homes - based on Energy Information Administration, 2009 Residential Energy Consumption Survey). In 2000, 60% of furnaces purchased in Iowa were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.60*0.92) + (0.40*0.8)) * (1-0.15) = 0.74.

⁶⁶ Based on data from Energy Information Administration, 2009 Residential Energy Consumption Survey, see "HC6.9 Space Heating in Midwest Region.xls".

2.1.4 Freezer

DESCRIPTION

A freezer meeting the efficiency specifications of ENERGY STAR is installed in place of a model meeting the federal standard (NAECA). Energy usage specifications are defined in the table below (note, AV is the freezer Adjusted Volume and is calculated as 1.73*Total Volume):

Product Category	Volume (cubic feet)	Federal Baseline Maximum Energy Usage in kWh/year ⁷⁰	ENERGY STAR Maximum Energy Usage in kWh/year ⁷¹
Upright Freezers with Manual Defrost	7.75 or greater	5.57*AV + 193.7	5.01*AV + 174.3
Upright Freezers with Automatic Defrost without an automatic icemaker	7.75 or greater	8.62*AV + 228.3	7.76*AV + 205.5
Upright Freezers with Automatic Defrost with an automatic icemaker	7.75 or greater	8.62*AV+312.3	7.76*AV+289.5
Built-In Upright freezers with automatic defrost without an automatic icemaker	7.75 or greater	9.86*AV+260.9	8.87*AV+234.8
Built-In Upright freezers with automatic defrost with an automatic icemaker	7.75 or greater	9.86*AV+344.9	8.87*AV+318.8
Chest Freezers and all other Freezers except Compact Freezers	7.75 or greater	7.29*AV + 107.8	6.56*AV + 97.0
Chest Freezers with automatic defrost	7.75 or greater	10.24*AV+148.1	9.22*AV+133.3
Compact Upright Freezers with Manual Defrost	< 7.75 and 36 inches or less in height	8.65*AV + 225.7	7.79*AV + 203.1
Compact Upright Freezers with Automatic Defrost	< 7.75 and 36 inches or less in height	10.17*AV + 351.9	9.15*AV + 316.7
Compact Chest Freezers	<7.75 and 36 inches or less in height	9.25*AV + 136.8	8.33*AV + 123.1

This measure also includes a section accounting for the interactive effect of reduced waste heat on the heating and cooling loads.

This measure was developed to be applicable to the following program types: TOS, NC.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient equipment is defined as a freezer meeting the efficiency specifications of ENERGY STAR, defined as using at least 10% less measured energy than the minimum federal efficiency standards.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is assumed to be a model that meets the federal minimum standard for energy efficiency. The standard varies depending on the size and configuration of the freezer (chest freezer or upright freezer, automatic or manual defrost) and is defined in the table above.

2.1.5 Refrigerator and Freezer Recycling

DESCRIPTION

This measure describes savings from the retirement and recycling of inefficient but operational refrigerators and freezers. Savings are provided in two ways. First, a regression equation is provided that requires the use of key inputs describing the retired unit (or population of units) and is based on a 2013 workpaper provided by Cadmus that used data from a 2012 ComEd metering study and metering data from a Michigan study. The second methodology is a deemed approach based on an evaluation of 2016 Ameren Illinois Company Appliance Recycling Program.

The savings are equivalent to the Unit Energy Consumption of the retired unit and should be claimed for the assumed remaining useful life of that unit. A part-use factor is applied to account for those secondary units that are not in use throughout the entire year. The user should note that the regression algorithm is designed to provide an accurate portrayal of savings for the population as a whole and includes those parameters that have a significant effect on the consumption. The precision of savings for individual units will vary. This measure also includes a section accounting for the interactive effect of reduced waste heat on the heating and cooling loads.

This measure was developed to be applicable to the following program types: ERET.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The existing inefficient refrigerator is removed from service and not replaced.

DEFINITION OF BASELINE EQUIPMENT

The existing inefficient unit must be operational and have a capacity of between 10 and 30 cubic feet.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The estimated remaining useful life of the recycling units is 6.5 years.⁹³

DEEMED MEASURE COST

Measure cost includes the cost of pickup and recycling of the refrigerator and should be based on actual costs of running the program. If unknown, assume \$120per unit.⁹⁴

LOADSHAPE

Loadshape RE16 - Residential Refrigerator

Loadshape RE15 – Residential Freezer

⁹³ DOE refrigerator and freezer survival curves are used to calculate RUL for each equipment age and develop a RUL schedule. The RUL of each unit in the ARCA database is calculated and the average RUL of the dataset serves as the final measure RUL. Refrigerator recycling data from ComEd, IL (PY7-PY9) and Ameren, IL (PY6-PY8) were used to determined EUL with the DOE survival curves from the 2009 TSD. A weighted average of the retailer ComEd data and the Ameren data results in an average of 6.5 years. See Navigant 'ComEd Effective Useful Life Research Report', May 2018.

⁹⁴ Based on similar Efficiency Vermont program.

CALCULATION OF SAVINGS

ENERGY SAVINGS

Regression analysis; Refrigerators

Energy savings for refrigerators are based upon a linear regression model using the following coefficients:⁹⁵

Independent Variable Description	Estimate Coefficient
Intercept	83.324
Age (years)	3.678
Pre-1990 (=1 if manufactured pre-1990)	485.037
Size (cubic feet)	27.149
Dummy: Side-by-Side (= 1 if side-by-side)	406.779
Dummy: Primary Usage Type (in absence of the program) (= 1 if primary unit)	161.857
Interaction: Located in Unconditioned Space x CDD/365.25	15.366
Interaction: Located in Unconditioned Space x HDD/365.25	-11.067

 $\Delta kWh_{Unit} = [83.32 + (Age * 3.68) + (Pre - 1990 * 485.04) + (Size * 27.15) + (Side - by - side * 406.78) + (Primary Usage * 161.86) + (CDD/365.25 * unconditioned * 15.37) + (HDD/365.25 * unconditioned * -11.07)] * Part Use Factor$

Where:

Age	= Age of retired unit	
Pre-1990	= Pre-1990 dummy (=1 if manufactured pre-1990, else 0)	
Size	= Capacity (cubic feet) of retired unit	
Side-by-side	= Side-by-side dummy (= 1 if side-by-side, else 0)	
Single-Door	= Single-door dummy (= 1 if Single-door, else 0)	
Primary Usage	= Primary Usage Type (in absence of the program) dummy	
	(= 1 if Primary, else 0)	
CDD	= Cooling Degree Days	
	= Dependent on location: ⁹⁶	
	Climate Zene	

Climate Zone (City based upon)	CDD 65	CDD/365.25
5 (Burlington)	1209	3.31
6 (Mason City)	616	1.69
Average/unknown	1,068	2.92

Unconditioned = If unit in unconditioned space = 1, otherwise 0

⁹⁵ Coefficients provided in July 30, 2014 memo from Cadmus: "Appliance Recycling Update no single door July 30 2014". Based on the specified regression, a small number of units may have negative energy and demand consumption. These are a function of the unit size and age, and should comprise a very small fraction of the population. While on an individual basis this result is counterintuitive, it is important that these negative results remain such that as a population the average savings is appropriate. ⁹⁶ National Climatic Data Center, calculated from 1981-2010 climate normals with a base temp of 65°F.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.1.5 Refrigerator and Freezer Recycling

Note unconditioned means a space that is not intentionally heated via furnace vents or boiler radiators. The presence of and/or leakage from a heating system in a space doesn't in itself imply the space is conditioned.

HDD

= Heating Degree Days

= Dependent on location:97

Climate Zone (City based upon)	HDD 60	HDD/365.25
5 (Burlington)	4,496	12.31

⁹⁹ Table 11. PY9 Mean Explanatory Variables, Impact and Process Evaluation of 2016 (PY9) Ameren Illinois Company Appliance Recycling Program, Opinion Dynamics, October 13, 2017.

¹⁰⁰ Estimated using PY6 Illinois survey responses. Page 12, Impact and Process Evaluation of 2016 (PY9) Ameren Illinois Company Appliance Recycling Program, Opinion Dynamics, October 13, 2017.

¹⁰¹ Coefficients provided in January 31, 2013 memo from Cadmus: "Appliance Recycling Update". Based on the specified regression, a small number of units may have negative energy and demand consumption. These are a function of the unit size and age, and should comprise a very small fraction of the population. While on an individual basis this result is counterintuitive it is important that these negative results remain such that as a population the average savings is appropriate.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.1.5 Refrigerator and Freezer Recycling

Independent Variable Description	Estimate Coefficient
Pre-1990 (=1 if manufactured pre-1990)	156.181
Size (cubic feet)	31.839
Chest Freezer Configuration (=1 if chest freezer)	-19.709
Interaction: Located in Unconditioned Space x CDD/365.25	9.778
Interaction: Located in Unconditioned Space x HDD/365.25	-12.755

$$\begin{split} \Delta kWh_{Unit} &= [132.12 + (Age * 12.13) + (Pre - 1990 * 156.18) + (Size * 31.84) + \\ & (Chest \, Freezer \, * \, -19.71) + (CDD/365.25 * unconditioned \, * \, 9.78) + \\ & (HDD/365.25 * unconditioned \, * \, -12.75)] \, * \, Part \, Use \, Factor \end{split}$$

Where:

Age	= Age of retired unit
Pre-1990	= Pre-1990 dummy (=1 if manufactured pre-1990, else 0)
Size	= Capacity (cubic feet) of retired unit
Chest Freezer	= Chest Freezer dummy (= 1 if chest freezer, else 0)
CDD	= Cooling Degree Days (see table in refrigerator section)
Unconditioned	= If unit in unconditioned space = 1, otherwise 0
HDD	= Heating Degree Days (see table in refrigerator section)
Part Use Factor	= To account for those units that are not running throughout the entire year. If available, part-use factor participant survey results should be used. If not available, assume 0.86. ¹⁰²

Deemed approach; Freezers

$$\Delta kWh_{Unit} = UEC * Part Use Factor$$

Where:

UEC _{Retired}	= Unit Energy Consumption of retired unit
	= 944 kWh ¹⁰³
Part Use Factor	= To account for those units that are not running throughout the entire year. If available, part-use factor participant survey results should be used. If not available, assume 0.86. ¹⁰⁴
ΔkWh_{Unit}	= 944 * 0.86
	= 811.8 kWh

Additional Waste Heat Impacts

Only for retired units from conditioned spaces in the home (if unknown, assume unit is from unconditioned space).

Fossil Fuel	0%
Unknown	17% ¹⁰⁸

WHFeCool = Waste Heat Factor for Energy to account for cooling savings from removing waste heat from refrigerator/freezer.

= (CoolF / ηCool) * %Cool

If unknown, assume 0

CoolF = Cooling Factor or percentage of reduced waste heat that no longer needs to be

¹⁰⁵ Based on 217 days where HDD 60>0, divided by 365.25.

¹⁰⁶ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Heat Pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

 ¹⁰⁷ Calculation assumes 33% Heat Pump and 67% Resistance, which is based upon data from Energy Information
 Administration, 2009 Residential Energy Consumption Survey, see "HC6.9 Space Heating in Midwest Region.xls". Average efficiency of heat pump is based on the assumption that 50% are units from before 2006 and 50% 2006-2014.
 ¹⁰⁸ Based on Dunsky and Opinion Dynamics Baseline Study results.

	Unknown 83% ¹¹⁵					
	_			-		

0.03412 = Converts kWh to Therms

PEAK GAS SAVINGS

Heating penalty for reduction in waste heat, only for retired units from conditioned space in gas heated home (if unknown, assume unit is from unconditioned space).

For ease of application, savings for this measure is assumed to be evenly spread across the year. The Peak Gas Savings is therefore assumed to be:

¹¹³ Based on 217 days where HDD 60>0, divided by 365.25.

¹¹⁴ This has been estimated assuming that natural gas central furnace heating is typical for Iowa residences (the predominant heating is gas furnace with 49% of Iowa homes - based on Energy Information Administration, 2009 Residential Energy Consumption Survey). In 2000, 60% of furnaces purchased in Iowa were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.60*0.92) + (0.40*0.8)) * (1-0.15) = 0.74.

¹¹⁵ Based on Dunsky and Opinion Dynamics Baseline Study results.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.1.5 Refrigerator and Freezer Recycling

$$\Delta PeakTherms = \frac{(\Delta Therms)}{HeatDays}$$

Iowa Energy Efficiency Statewide Technical Reference Manual—2.1.6 Room Air Conditioner

2.1.6 Room Air Conditioner

DESCRIPTION

This measure relates to the purchase and installation of a room air conditioning unit that meets the ENERGY STAR minimum qualifying efficiency specifications, in place of a baseline unit meeting minimum Federal Standard. The minimum efficiency ratings are presented below.¹¹⁷ Please note that the baseline and default ENERGY STAR levels are based upon the average of available product from the CEC Appliance Database.

Product Class (Btu/H)	Federal Standard CEERbase, with louvered sides, without reverse cycle ¹¹⁸	Federal Standard CEERbase, without louvered sides, without reverse cycle	ENERGY STAR CEERee, with louvered sides	ENERGY STAR CEERee, without louvered sides
< 8,000	11.0	10.0	12.1	11.0
8,000 to 10,999	10.9	9.6	12.0	10.6
11,000 to 13,999		9.5	12.0	10.5
14,000 to 19,999	10.7	9.3	11.8	10.2
20,000 to 24,999	9.4		10.3	
25,000-27,999	0.0	9.4	10.3	10.3
>=28,000	9.0		9.9	

Casement	Federal Standard CEERbase	ENERGY STAR CEERee
Casement-only	9.5	10.5
Casement-slider	10.4	11.4

Reverse Cycle - Product Class (Btu/H)	Federal Standard CEERbase, with louvered sides	Federal Standard CEERbase, without louvered sides ¹¹⁹	ENERGY STAR CEERee, with louvered sides ¹²⁰	ENERGY STAR CEERee, without louvered sides
< 14,000	N/A	9.3	N/A	10.2
>= 14,000	N/A	8.7	N/A	9.6
< 20,000	9.8	N/A	10.8	N/A
>= 20,000	9.3	N/A	10.2	N/A

¹¹⁷Side louvers that extend from a room air conditioner model in order to position the unit in a window. A model without louvered sides is placed in a built-in wall sleeve and are commonly referred to as "through-the-wall" or "built-in" models. Casement-only refers to a room air conditioner designed for mounting in a casement window of a specific size. Casement-slider refers to a room air conditioner with an encased assembly designed for mounting in a sliding or casement window of a specific size. Reverse cycle refers to the heating function found in certain room air conditioner models. https://www.energystar.gov/sites/default/files/ENERGY%20STAR%20Version%204.0%20Room%20Air%20Conditioners%20Prog ram%20Requirements.pdf

Note these efficiency levels represent ratings without the Connected Allowance.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.1.6 Room Air Conditioner

This measure was developed to be applicable to the following program types: TOS. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure the new room air conditioning unit must meet the ENERGY STAR efficiency standards presented above. For default savings, the average efficiency of ENERGY STAR qualified units is used as shown in tables below.¹²¹

DEFINITION OF BASELINE EQUIPMENT

The baseline assumption is a new room air conditioning unit that meets the current minimum federal efficiency standards presented above. The average efficiency of non-ENERGY STAR units is used as shown in tables below:

Product Class (Btu/H)	Federal Standard CEERbase, with louvered sides, without reverse cycle	Federal Standard CEERbase, without louvered sides, without reverse cycle	ENERGY STAR CEERee, with louvered sides	ENERGY STAR CEERee, without louvered sides
< 8,000	11.0	10.0	12.1	11.0
8,000 to 10,999	11.1	9.7	12.0	10.7
11,000 to 13,999		9.6	12.0	10.6
14,000 to 19,999	10.9	9.3	11.8	11.1
20,000 to 24,999	9.7		10.3	
25,000-27,999	0.4	9.6	10.5	10.3
>=28,000	9.4		9.9	

Casement	Federal Standard CEERbase	ENERGY STAR CEERee
Casement-only	9.5	10.5
Casement-slider	10.5	11.4

Reverse Cycle - Product Class (Btu/H)	Federal Standard CEERbase, with louvered sides	Federal Standard CEERbase, without louvered sides	ENERGY STAR CEERee, with louvered sides	ENERGY STAR CEERee, without louvered sides
< 14,000	N/A	9.5	N/A	10.4
>= 14,000	N/A	8.7	N/A	9.6
< 20,000	9.8	N/A	10.8	N/A
>= 20,000	9.3	N/A	10.2	N/A

¹²¹ Based on review of units on the CEC Appliance Database, accessed 03/26/2018. See "Room AC CEC Database_03262018_v3.xls" for more details. Note where no product is available for a particular category, the minimum is used.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.1.6 Room Air Conditioner

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life is assumed to be 9 years.¹²²

DEEMED MEASURE COST

The incremental cost for this measure is assumed to be \$50 for an ENERGY STAR unit.¹²³

MEASURE CODE: RS-APL-RMAC-V03-190101

SUNSET DATE: 1/1/2021*

* Currently, no utilities are offering this measure, and it is therefore overdue for a reliability review. If a utility plans to start using this measure again, it should be reviewed accordingly.

¹²⁶ Consistent with coincidence factors found in: RLW Report: Final Report Coincidence Factor Study Residential Room Air Conditioners, June 23, 2008

⁽http://www.puc.nh.gov/Electric/Monitoring%20and%20Evaluation%20Reports/National%20Grid/117 RLW CF%20Res%20RA C.pdf)

¹²⁷ Since the new CEER rating includes standby and off power consumption, for peak calculations it is more appropriate to apply the EER rating, but it appears as though new units will only be rated with a CEER rating. Version 3.0 of the ENERGY STAR specification provided equivalent EER and CEER ratings and for the most popular size band the EER rating is approximately 1% higher than the CEER. See 'ENERGY STAR Version 3.1 Room Air Conditioners Program Requirements'.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.1.7 Room Air Conditioner Recycling

2.1.7 Room Air Conditioner Recycling

DESCRIPTION

This measure describes the savings resulting from running a drop-off service taking existing residential, inefficient Room Air Conditioner units from service prior to their natural end of life. This measure assumes that a percentage of these units will be replaced with a baseline standard efficiency unit (note that if it is actually replaced by a new ENERGY STAR qualifying unit, the savings increment between baseline and ENERGY STAR will be recorded in the Efficient Products program).

This measure was developed to be applicable to the following program types: ERET.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

N/A. This measure relates to the retiring of an existing inefficient unit.

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is the existing inefficient room air conditioning unit.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The assumed remaining useful life of the existing room air conditioning unit being retired is 4 years.¹²⁸

DEEMED MEASURE COST

The actual implementation cost for recycling the existing unit should be used.

LOADSHAPE

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \frac{\Delta kWh}{Hours} * CF$$

Where:

CF

= Summer Peak Coincidence Factor for measure

for Room AC, and adjusted by CDD for the other locations.

¹³⁰ Based on maximum capacity average from the RLW Report; "Final Report Coincidence Factor Study Residential Room Air Conditioners, June 23, 2008."

¹³¹ The Federal Minimum for the most common type of unit (8000 – 13999 Btuh with side vents) from 1990-2000 was 9.0 EER, from 2000-2014 it was 9.8 EER, and is currently (2015) 10.9 CEER. Retirement programs will see a large array of ages being retired, and the true EER of many will have been significantly degraded. We have selected 9.0 as a reasonable estimate of the average retired unit. This is supported by material on the ENERGY STAR website, which, if reverse-engineered, indicates that an EER of 9.16 is used for savings calculations for a 10-year old RAC. Another statement indicates that units that are at least 10 years old use 20% more energy than a new ES unit, which equates to: 10.9EER/1.2 = 9.1 EER;

http://www.energystar.gov/ia/products/recycle/documents/RoomAirConditionerTurn-InAndRecyclingPrograms.pdf ¹³² Based on Nexus Market Research Inc, RLW Analytics, December 2005; "Impact, Process, and Market Study of the Connecticut Appliance Retirement Program: Overall Report." Report states that 63% were replaced with ENERGY STAR units and 13% with non-ENERGY STAR. However, this formula assumes all are non-ENERGY STAR since the increment of savings between baseline units and ENERGY STAR would be recorded by the Efficient Products program when the new unit is purchased.

¹³³ Minimum Federal Standard for capacity range and most popular class (Without reverse cycle, with louvered sides, and 8,000 to 13,999 Btu/h); http://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/41

Iowa Energy Efficiency Statewide Technical Reference Manual—2.1.8 ENERGY STAR Air Purifier/Cleaner

2.1.8 ENERGY STAR Air Purifier/Cleaner

DESCRIPTION

An air purifier (cleaner) meeting the efficiency specifications of ENERGY STAR is purchased and installed in place of a non-ENERGY STAR model.

This measure was developed to be applicable to the following program types: TOS, NC.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient equipment is defined as an air purifier meeting the efficiency specifications of ENERGY STAR as provided below.

- Must produce a minimum 30 Clean Air Delivery Rate (CADR) for Smoke¹³⁵ to be considered under this specification.
- UL Safety Requirement: Models that emit ozone as a byproduct of air cleaning must meet UL Standard 867 (ozone production must not exceed 50ppb).
- Minimum Performance Requirements for Smoke as listed below:¹³⁶

Smoke CADR Bins	Minimum Smoke CADR/W
30 ≤ CADR < 100	1.9
100 ≤ CADR < 150	2.4
150 ≤ CADR < 200	2.9
200 ≤ CADR	2.9

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is assumed to be a conventional unit¹³⁷ that does not meet ENERGY STAR Efficiency Requirements.¹³⁸

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life is assumed to be 9 years.¹³⁹

DEEMED MEASURE COST

The incremental cost for this measure is dependent on the Air Purifier size in CADR of Smoke. ¹⁴⁰ Product Size	Smoke CADR/W	Average Purchase Cost (\$)	Average Incremental Cost (\$)	
30 ≤ CADR < 100	1.90	\$ 82.49	\$	8.44
100 ≤ CADR < 150	2.40	\$ 140.43	\$	22.33
150 ≤ CADR < 200	2.90	\$ 349.00	\$	92.34
200 ≤ CADR	2.90	\$ 264.49	\$	44.50

¹³⁵ Measured according to the latest ANSI/AHAM AC-1 (AC-1) Standard.

¹³⁶ ENERGY STAR Program Requirements for Room Air Cleaners - Eligibility Criteria V2.0.

¹³⁷ As defined as the average of non-ENERGY STAR products found in EPA research, 2011, ENERGY STAR Qualified Room Air Cleaner Calculator.

LOADSHAPE

Loadshape E01 – Flat

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

 ΔkWh = Annual Electrical Savings

Where

Annual Electrical Savings = Electrical Savings in kWh, for the specific CADR range as outlined in the table below:¹⁴¹

CADR Range	Electrical Savings (kWh)
30 ≤ Smoke CADR < 100	39
100 ≤ Smoke CADR < 150	95
150 ≤ Smoke CADR < 200	173
200 ≤ Smoke CADR	328

Assumptions considered for the table above are:

The baseline used to calculate savings was a Smoke CADR/W equivalent just under the ENERGY STAR V1.2 at a Dust CADR/W of 1.9. Calculations assume (1) Smoke CADR/W is equal to the Dust CADR/W divided by Dust CADR and multiplied by Smoke CADR.

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \frac{\Delta kWh}{Hours} * CF$$

Where:

ΔkWh	= Gross customer annual kWh savings for the measure
Hours	= Average hours of use per year
	= 5844 hours ¹⁴²
CF	= Summer Peak Coincidence Factor for measure
	= 66.7% ¹⁴³

		A 1.3A/
	Clean Air Delivery Rate	ΔkW
	30 ≤ CADR < 100	0.005
NATURAL GAS SAVINGS	100 ≤ CADR < 150	0.011
	150 ≤ CADR < 200	0.020
N/A	200 ≤ CADR	0.037

¹⁴¹ ENERGY STAR V2 Room Air Cleaners Data Package (October 11, 2019). See file "ENERGY STAR V2 Room Air Cleaners Data Package_GH 05122020_VEIC.xlsx"

¹⁴² Consistent with ENERGY STAR Qualified Room Air Cleaner Calculator assumption of 16 hours per day (16 * 365.25 = 5844).

¹⁴³ Assumes that the purifier usage is evenly spread throughout the year, therefore coincident peak is calculated as 5844/8766 = 66.7%.

DEEMED O&M COST ADJUSTMENT CALCULATION

There are no operation and maintenance cost adjustments for this measure.¹⁴⁴

MEASURE CODE: RS-APL-AIRP-V02-210101

SUNSET DATE: 1/1/2026

¹⁴⁴ Some types of room air cleaners require filter replacement or periodic cleaning, but this is likely to be true for both efficient and baseline units and so no difference in cost is assumed.

2.2 Consumer Electronics

2.2.1 Tier 1 Advanced Power Strip (APS)

DESCRIPTION

This measure relates to Tier 1 Advanced Power Strips which are multi-plug power strips with the ability to automatically disconnect specific connected loads depending upon the power draw of a master control load, also plugged into the strip. Power is disconnected from the switched (controlled) outlets when the master control load power draw is reduced below a certain adjustable threshold, thus turning off the appliances plugged into the switched outlets. By disconnecting, the standby load of the controlled devices, the overall load of a centralized group of equipment (i.e., entertainment centers and home office) can be reduced. Uncontrolled outlets are also provided that are not affected by the control device and so are always providing power to any device plugged into it. This measure characterization provides savings for use of the Advanced Power Strip in an entertainment, office or unknown setting.

This measure was developed to be applicable to the following program types: TOS, NC, DI.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient case is the use of a 4-8 plug Tier 1 master controlled advanced power strip.

DEFINITION OF BASELINE EQUIPMENT

For time of sale or new construction applications, the assumed baseline is a standard power strip that does not control connected loads.

For direct install programs, the baseline is the existing equipment utilized in the home.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The assumed lifetime of the advanced power strip is 7 years.¹⁴⁵

DEEMED MEASURE COST

For time of sale or new construction, the incremental cost of a Tier 1 advanced power strip over a standard power strip with surge protection is assumed to be \$9¹⁴⁶ (\$28 for advanced power strip and \$19 for baseline).

For direct install programs, the actual full installed cost (including labor) should be used.

LOADSHAPE

Loadshape RE05 – Residential Multifamily Plug Load

Loadshape RE13 – Residential Single-Family Plug Load

COINCIDENCE FACTOR

The summer peak coincidence factor for this measure is assumed to be 80%.¹⁴⁷

¹⁴⁵ This is a consistent assumption with 2.2.2 Advanced Power Strip – Tier 2.

¹⁴⁶ 2016 Price survey performed by Illume Advising LLC, see "Current Surge Protector Costs and Comparison 7-2016" spreadsheet.

¹⁴⁷ In the absence of empirical evaluation data, this was based on assumptions of the typical run pattern for televisions and computers in homes.

¹⁵³ Average of hours for controlled TV and computer from; NYSERDA Measure Characterization for Advanced Power Strips ¹⁵⁴ In the absence of empirical evaluation data, this was based on assumptions of the typical run pattern for televisions and computers in homes.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.2.2 Tier 2 Advanced Power Strips (APS) – Residential Audio Visual

2.2.2 Tier 2 Advanced Power Strips (APS) – Residential Audio Visual

DESCRIPTION

This measure relates to the installation of a Tier 2 Advanced Power Strip / surge protector for household audio visual environments (Tier 2 AV APS). Tier 2 AV APS are multi-plug power strips that remove power from audio visual equipment through intelligent control and monitoring strategies. By utilizing advanced control strategies such as a countdown timer, external sensors (e.g., of infra-red remote usage and/or occupancy sensors, true RMS (Root Mean Square) power sensing;¹⁵⁵ both active power loads and standby power loads of controlled devices are managed by Tier 2 AV APS devices. Monitoring and controlling both active and standby power loads of controlled devices will reduce the overall load of a centralized group of electrical equipment (i.e., the home entertainment center). This more intelligent sensing and control process has been demonstrated to deliver increased energy savings and demand reduction compared with 'Tier 1 Advanced Power Strips.'

To date there have been two distinct control strategies to reduce the active AV loads:

- Infra-red only this type will begin a count down from the last remote-control signal. Once the set time
 period is reached without an additional remote signal, there will be a warning (visual and/or audio) to warn
 the user that the units are about to be switched off. If the user does not then indicate they are still actively
 using the equipment by using the remote control, the system will switch off.
- 2. Infra-red and occupancy sensor in addition to the remote-control signal count down, this system uses motion detection to determine if there is an active user. Only after a set period of no remote-control activity or motion is sensed in the space will a similar warning and ultimate switch off occur.

The Tier 2 APS market is a relatively new and developing one. With several new Tier 2 APS products coming to market, it is important that energy savings are clearly demonstrated through independent field trials. Due to the inherent variance day to day and week to week for hours of use of AV systems, it is critical that field trial studies effectively address the variability in usage patterns. There is significant discussion in the EM&V and academic domain on the optimal methodology for controlling for these factors and in submitting evidence of energy savings, it is critical that that these issues are adequately addressed. It is therefore recommended that only models that have provided independent evidence to demonstrate an appropriate deemed savings should be eligible, please see Product Classification memo.

This measure was developed to be applicable to the following program types: DI. If applied to other program delivery types, the installation characteristics including the number of AV devices under control and an appropriate in service rate should be verified through evaluation.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient case is the use of a Tier 2 AV APS in a residential AV (home entertainment) environment that includes control of at least 2 AV devices with one being the television.¹⁵⁶

DEFINITION OF BASELINE EQUIPMENT

The assumed baseline equipment is the existing equipment being used in the home (e.g., a standard power strip or wall socket that does not control loads of connected AV equipment).

¹⁵⁵ Tier 2 AV APS identify when people are not engaged with their AV equipment and then remove power, for example a TV and its peripheral devices that are unintentionally left on when a person leaves the house or for instance where someone falls asleep while watching television.

¹⁵⁶ Given this requirement, an AV environment consisting of a television and DVD player or a TV and home theater would be eligible for a Tier 2 AV APS installation.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.2.2 Tier 2 Advanced Power Strips (APS) – Residential Audio Visual

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The default deemed lifetime value for Tier 2 AV APS is assumed to be 7 years.¹⁵⁷

DEEMED MEASURE COST

Direct Installation: The actual installed cost (including labor) of the new Tier 2 AV APS equipment should be used.

Time of Sale: The full cost of a new Tier 2 Advanced Power Strip should be assumed, with a default of \$80.158

LOADSHAPE

Loadshape RE05 – Residential Multifamily Plug Load

Loadshape RE13 – Residential Single-Family Plug Load

COINCIDENCE FACTOR

The summer peak coincidence factor for this measure is assumed to be 80%.¹⁵⁹

¹⁶¹ This is estimate based on assumption that approximately half of savings are during active hours (assumed to be 5.3 hrs/day, 1936 per year (NYSERDA 2011. "Advanced Power Strip Research Report")) and half during standby hours (8760-1936 = 6824 hours). The weighted average is 4380.

¹⁶² In the absence of empirical evaluation data, this was based on assumptions of the typical run pattern for televisions and computers in homes.

Iowa Energy Efficiency Statewide Technical Reference Manual-2.3.1 Gas Water Heater

2.3 Hot Water

2.3.1 Gas Water Heater

DESCRIPTION

This measure applies to gas water heaters under the following program types:

Time of Sale or New Construction:

The purchase and installation of a new, residential gas-fired storage or tankless water heater meeting program Uniform Energy Factor (UEF) requirements, in place of a storage unit meeting Federal standards.

Early Replacement:

The early removal of an existing and functioning, residential gas-fired storage or tankless water heater, prior to its natural end of life, and replacement with a new unit meeting program Uniform Energy Factor (UEF) requirements. Savings are calculated between existing unit and efficient unit consumption during the remaining life of the existing unit, and between new baseline unit and efficient unit consumption for the remainder of the measure life.¹⁶³

This measure was developed to be applicable to the following program types: TOS, NC, EREP.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a residential gas-fired storage water heater or tankless water heater meeting ENERGY STAR criteria.¹⁶⁴

DEFINITION OF BASELINE EQUIPMENT

Time of Sale or New Construction: The baseline equipment is assumed to be a new, gas-fired storage residential water heater meeting minimum Federal efficiency standards. For storage water heaters with a storage capacity equal to or less than 55 gallons, the Federal energy factor requirement is calculated as 0.6483 - (0.0017 * storage capacity in gallons) and $0.7897 - (0.0004 \times \text{ storage capacity in gallons})$ for greater than 55 gallon storage water heaters.¹⁶⁵

Early Replacement: The baseline is the efficiency of the existing gas water heater for the remaining useful life of the unit and the efficiency of a new gas water heater of the same type meeting minimum Federal efficiency standards for the remainder of the measure life.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 11 years for a gas storage water heater and 20 years for a gas tankless water heater.¹⁶⁶

For Early Replacement: The remaining life of existing equipment is assumed to be 3.7 for gas storage water heaters

¹⁶⁴ ENERGY STAR Product Specification for Residential Water Heaters, Version 3.2, effective April 16, 2015

https://www.ecfr.gov/cgi-bin/text-idx?SID=80dfa785ea350ebeee184bb0ae03e7f0&mc=true&node=se10.3.430_132&rgn=div8 ¹⁶⁶ 2014 Database for Energy-Efficiency Resources (DEER), Version 2014, "Cost Values and Summary Documentation", California Public Utilities Commission, January, 2014.

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.3.1 Gas Water Heater

and 6.7 years for gas tankless water heaters.¹⁶⁷

DEEMED MEASURE COST

Time of Sale or New Construction:

The incremental capital cost for this measure is dependent on the type of water heater, as listed below. Actual costs may be used if associated baseline costs can also be estimated for the application.

Water Heater Type	Incremental Capital Cost ¹⁶⁸	Full Install Cost ¹⁶⁹
Baseline Storage Unit	N/A	\$1,336
Efficient Storage	\$320	\$1,656
Efficient Tankless	\$1,560	\$2,896

Early Replacement: Actual full installed costs should be used where available. If actual costs are unavailable, the full installed cost is provided in the table above. The assumed deferred cost (after 4 years) of replacing existing equipment with a new baseline unit is assumed to be \$1,336. This cost should be discounted to present value using the utility's discount rate.¹⁷⁰

¹⁷⁵ Deoreo, B., and P. Mayer. Residential End Uses of Water Study 2013 Update. Water Research Foundation, 2014.

¹⁷⁶ Average household size by building type and water heater fuel type based on the 2007 RASS.

¹⁷⁷ Bedrooms are suitable proxies for household occupancy, and may be preferable to actual occupancy due to turnover rates in residency and non-adult population impacts.

Iowa Energy Efficiency Statewide Technical Reference Manual-2.3.1 Gas Water Heater

	= 8.33 pounds per gallon
T _{Out}	= Tank temperature
	= 126.5°F ¹⁷⁸
T _{In}	= Incoming water temperature from well or municipal system
	= 56.5°F ¹⁷⁹
1.0	= Heat capacity of water (1 Btu/lb*°F)
100,000	= Conversion factor from Btu to therms

For example, a new 50-gallon gas storage water heater installed in a single family home under the Time of Sale program type, using defaults from above, would save:

ΔTherms = (1/0.5633 - 1/0.64) * (17.6 * 2.12 * 365.25 * 8.33 * (126.5 - 56.5) * 1.0) / 100,000 = 16.9 therms

PEAK GAS SAVINGS

 $\Delta PeakTherms = \Delta Therms/365.25$

Where:

 Δ Therms = Gas savings from installation of efficient water heater

Other variables as defined above

For example, a new 50-gallon gas storage water heater installed in a single family home under the Time of Sale program type, using defaults from above, would save:

 $\Delta PeakTherms = 16.9/365.25$

= 0.0463 therms

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.3.2 Heat Pump Water Heaters

2.3.2 Heat Pump Water Heaters

DESCRIPTION

This measure characterizes the installation of a heat pump domestic hot water heater in a home. Savings are presented dependent on the heating system installed in the home due to the impact of the heat pump water heater on the heating and cooling loads.

This measure was developed to be applicable to the following program types: TOS, NC, RF.¹⁸⁰

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be an ENERGY STAR Heat Pump domestic water heater.¹⁸¹

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is a new electric water heater meeting federal minimum efficiency standards,¹⁸² dependent on the storage volume (in gallons) of the water heater.

For units ≤55 gallons – resistance storage unit with efficiency: 0.9307 – (0.0002 * rated volume in gallons)

For units >55 gallons – assume a 50 gallon resistance tank baseline i.e. 0.9207 UEF.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

>55 gallons

The expected measure life is assumed to be 13 years.¹⁸³

DEEMED MEASURE COST

For Time of Sale or New Construction the incremental installation cost (including labor) should be used. Defaults are provided below.¹⁸⁴ Actual efficient costs can also be used although care should be taken as installation costs can vary significantly due to complexities of a particular site.

			· ·	
Capacity	Efficiency	Baseline	Efficient	Incremental
Capacity	Range	Installed Cost	Installed Cost	Installed Cost
	<2.6 UEF	\$1,032	\$2,062	\$1,030
≤55 gallons	≥2.6 UEF	\$1,032	\$2,231	\$1,199

\$1,319

\$1,319

\$2,432

\$3,116

\$1,113

\$1,797

For retrofit costs, the actual full installation cost should be used (default provided below if unknown).

¹⁸² Minimum Federal Standard as of 4/1/2015. Medium draw pattern;

¹⁸⁴ Costs for <2.6 UEF are based upon averages from the NEEP Phase 3 Incremental Cost Study;

<2.6 UEF

≥2.6 UEF

¹⁸⁰ If the existing water heater has an Energy Factor (EF) rating and the efficient model has a UEF rating, use the baseline EF and efficient UEF in the below algorithm.

¹⁸¹ If the water heater does not have a UEF rating, but a EF rating, revert to using the previous version of this measure.

https://www.ecfr.gov/cgi-bin/text-idx?SID=80dfa785ea350ebeee184bb0ae03e7f0&mc=true&node=se10.3.430_132&rgn=div8 ¹⁸³ DOE, 2010 Residential Heating Products Final Rule Technical Support Document, Chapter 8, Page 8-46.

¹⁸⁹ CPUC Residential Retrofit - High Impact Measure Evaluation Report Draft. Dec. 7, 2009. Pg 76. Average temperature setpoints for two utilities.

¹⁹⁰ Averaged monthly water main temperature calculated using the methodology provided in Building America Research Benchmark Definition, updated December 2009. Pg.19-20. <u>http://www.nrel.gov/docs/fy10osti/47246.pdf</u>; water main temperature represents the average of TMY3 data from all Class I stations located in Des Moines, IA.

¹⁹¹ This algorithm calculates the heat removed from the air by subtracting the HPWH electric consumption from the total water heating energy delivered. This is then adjusted to account for location of the HP unit and the coincidence of the waste heat with cooling requirements, the efficiency of the central cooling, and latent cooling demands.

¹⁹² Note unconditioned means a space that is not intentionally heated via furnace vents or boiler radiators. The presence of and/or leakage from a heating system in a space doesn't in itself imply the space is conditioned.

¹⁹³ REMRate determined percentage (34%) of lighting savings that result in reduced cooling loads (lighting is used as a proxy for hot water heating since load shapes suggest their seasonal usage patterns are similar).

¹⁹⁴ A sensible heat ratio (SHR) of 0.75 corresponds to a latent multiplier of 4/3 or 1.33. SHR of 0.75 for typical split system from page 10 of "Controlling Indoor Humidity Using Variable-Speed Compressors and Blowers" by M. A. Andrade and C. W. Bullard, 1999: www.ideals.illinois.edu/bitstream/handle/2142/11894/TR151.pdf

Iowa Energy Efficiency Statewide Technical Reference Manual -2.3.2 Heat Pump Water Heaters

Cooling System	%Cool
Unknown ¹⁹⁵	88%

$$= \left(\frac{\left(\left(1 - \frac{1}{\text{UEF}_{\text{EE}}}\right) * \text{ GPD } * \text{ Household } * 365.25 * \gamma \text{Water } * (\text{T}_{\text{OUT}} - \text{T}_{\text{IN}}) * 1.0\right) * \text{LF } * 53\%}{\text{COP}_{\text{HEAT}} * 3412}\right) * \% \text{ElectricHeat}$$

Where:

53% = Portion of reduced waste heat that results in increased heating load¹⁹⁶
 COP_{HEAT} = COP of electric heating system

= Actual system efficiency including duct loss - If not available, use:¹⁹⁷

System Type	Age of Equipment	HSPF Estimate	ηHeat (Effective COP Estimate) (HSPF/3.412)*0.85
	Before 2006	6.8	1.7
Heat Pump	2006 - 2014	7.7	1.92
	2015 on	8.2	2.04
Resistance	N/A	N/A	1

%ElectricHeat = Factor dependent on heating fuel:

Heating System	%ElectricHeat
Electric resistance or heat pump	100%
Gas	0%
Unknown heating fuel ¹⁹⁸	17%

 ¹⁹⁵ Based on assumption that 64% of homes have central cooling (based on Dunsky and Opinion Dynamics Baseline Study results).
 ¹⁹⁶ REMRate determined percentage (53%) of lighting savings that result in increased heating loads (lighting is used as a proxy for hot water heating since load shapes suggest their seasonal usage patterns are similar).

¹⁹⁷ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Heat Pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

¹⁹⁸ Based on Dunsky and Opinion Dynamics Baseline Study results.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.3.2 Heat Pump Water Heaters

For example, for a 2.0 UEF 50 gallon heat pump water heater in a single family home using default assumptions provided above: $kWh_ccool = (((1 - 1/2.0) * 17.6 * 2.12 * 365.25 * 8.33 * (126.5 - 56.5) * 1.0 * 0.5 * 0.34 * 1.33) / (3.08 * 3412)) * 0.88$ = 75.2 kWh $kWh_heat = (((1 - 1/2.0) * 17.6 * 2.12 * 365.25 * 8.33 * (126.5 - 56.5) * 1.0 * 0.5 * 0.53) / (1.38 * 3412)) * 0.17$ = 38.0 kWh $\Delta kWh = ((1 / 0.9207 - 1 / 2.0) * 17.6 * 2.12 * 365.25 * 8.33 * (126.5 - 56.5)) / 3412 + 75.2 - 38.0$ = 1402.3 kWhNote: whenever using the unknown heating fuel defaults, an additional therm penalty (to account for the percentage of homes with gas heat) should be applied.

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \frac{\Delta kWh}{Hours} * CF$$

Where:

= Full load hours of water heater
= 5186 ¹⁹⁹
= Summer Peak Coincidence Factor for measure
= 0.33 ²⁰⁰

For example, for a 2.0 UEF 50 gallon heat pump water heater using default assumptions provided above: $\Delta kW = 1402.3 / 5186 * 0.33$ = 0.0892 kW

NATURAL GAS SAVINGS

$$\Delta Therms = -\left(\frac{\left(\left(1-\frac{1}{UEF_{EE}}\right)*GPD*Household*365.25*\gamma Water*(T_{OUT}-T_{IN})*1.0\right)*LF*53\%}{\eta Heat*100,000}\right)*\%GasHeat$$

Where:

∆Therms

= Heating cost from conversion of heat in home to water heat for homes with Natural Gas heat²⁰¹

¹⁹⁹ Full load hours assumption based on analysis of loadshape data provided by Cadmus.

²⁰⁰ Calculated from Figure 8 "Combined six-unit summer weekday average electrical demand" in FEMP study; Field Testing of Pre-Production Prototype Residential Heat Pump Water Heaters

http://www1.eere.energy.gov/femp/pdfs/tir_heatpump.pdf as (average kW usage during peak period) / [(annual kWh savings / FLH)] = (0.1 kW) / ((1556 kWh (default assumptions) / 5183 hours) = 0.33.

²⁰¹ This is the additional energy consumption required to replace the heat removed from the home during the heating season by the heat pump water heater. The variable kWh_heating (electric resistance) is that additional heating energy for a home with electric resistance heat (COP 1.0). This formula converts the additional heating kWh for an electric resistance home to the MMBtu required in a Natural Gas heated home, applying the relative efficiencies.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.3.2 Heat Pump Water Heaters

0.03412 = conversion factor (therms per kWh)

nHeat = Efficiency of heating system, i.e., AFUE multiplied by distribution efficiency²⁰²

= Actual - If not available, use 74%.²⁰³

%GasHeat = Factor dependent on heating fuel:

Heating System	%GasHeat
Electric resistance or heat pump	0%
Natural Gas	100%
Unknown heating fuel ²⁰⁴	83%

Other factors as defined above

For example, for a 2.0 UEF 50 gallon heat pump water heater using default assumptions provided above:		
ΔTherms	= -(((1 - 1/2.0) * 17.6 * 2.12 * 365.25* 8.33 * (126.5 – 56.5) * 1.0 * 0.5 * 0.53) / (0.74 * 100000)) * 0.83	
	= - 11.8 therms	

PEAK GAS SAVINGS

Savings for this measure is assumed to be evenly spread across the heating season. The Peak Gas Savings is therefore assumed to be:

$$\Delta PeakTherms = \frac{\Delta Therms}{\text{HeatDays}}$$

Where:

ΔTherms	= Therm impact calculated above
HeatDays	= Heat season days per year
	= 217 ²⁰⁵

For example, for a 2.0 UEF 50 gallon heat pump water heater, using default assumptions provided above:

ΔPeakTherms = -11.8 / 217 = - 0.0544 therms

$$((0.60*0.92) + (0.40*0.8)) * (1-0.15) = 0.74$$

²⁰⁴ Based on Energy Information Administration, 2009 Residential Energy Consumption Survey.

 205 Number of days where HDD 60 >0.

²⁰² Ideally, the System Efficiency should be obtained either by recording the AFUE of the unit, or performing a steady state efficiency test. The Distribution Efficiency can be estimated via a visual inspection and by referring to a look-up table such as that provided by the Building Performance Institute: (<u>http://www.bpi.org/files/pdf/DistributionEfficiencyTable-BlueSheet.pdf</u>) or by performing duct blaster testing.

²⁰³ This has been estimated assuming that natural gas central furnace heating is typical for Iowa residences (the predominant heating is gas furnace with 49% of Iowa homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey:)). In 2000, 60% of furnaces purchased in Iowa were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows:

MEASURE CODE: RS-HWE-HPWH-V03-190101

SUNSET DATE: 1/1/2022

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.3.3 Water Heater Temperature Setback

2.3.3 Water Heater Temperature Setback

DESCRIPTION

Set point temperatures on hot water systems are often set higher than necessary. Savings are calculated for lowering the set temperature to 120-125 degrees (DOE recommended minimum to prevent Legionella contamination).

This measure was developed to be applicable to the following program types: RF, RNC.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The high efficiency measure is a hot water tank with the thermostat reduced from its existing temperature to a lower temperature between 120-125 degrees.

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is a hot water tank with a thermostat setting that is higher than 120 degrees, typically systems with settings of 130 degrees or higher. Note: if there is more than one DHW tank in the home at or higher than 130 degrees and they are all turned down, then the savings per tank can be multiplied by the number of tanks.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The assumed lifetime of the measure is 2 years.²⁰⁶

DEEMED MEASURE COST

The incremental cost of a setback is assumed to be \$10 for contractor time.²⁰⁷

LOADSHAPE

Loadshape RE12 – Residential Single Family Water Heat

Loadshape RE04 – Residential Multifamily Water Heat

Loadshape RG07 – Residential Water Heat (gas)

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS²⁰⁸

For homes with electric DHW tanks:

²⁰⁶ Professional judgment.

²⁰⁷ Based on labor cost of \$40/h and 15min work.

²⁰⁸ Note this algorithm provides savings only from reduction in standby losses. VEIC considered avoided energy from not heating the water to the higher temperature, but determined that dishwashers are likely to boost the temperature within the unit (roughly canceling out any savings); faucet and shower use is likely to be at the same temperature, so there would need to be more lower temperature hot water being used (cancelling any savings); and clothes washers will only see savings if the water from the tank is taken without any temperature control. It was felt the potential impact was too small to be characterized.

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.3.3 Water Heater Temperature Setback

$$\Delta kWh = \frac{(U * A * (Tpre - Tpost) * Hours)}{3412 * RE_electric}$$

Where:

U

= Overall heat transfer coefficient of tank (Btu/Hr-°F-ft²)

= Surface area of storage tank (square feet)

= Actual if known - If unknown, assume R-12, U = 0.083

А

= Actual if know - If unknown, use the table below based on capacity of tank. If capacity unknown, assume 50 gal tank; A = 24.99 ft².

Capacity (gal)	A (ft ²) ²⁰⁹
30	19.16
40	23.18
50	24.99
80	31.84

Tpre	= Actual hot water setpoint prior to adjustment. If unknown, assume 135 degrees	
------	---	--

Tpost	= Actual new hot water setpoint, which may not be lower than 120 degrees. If unknown, assume 120 degrees.
Hours	= Number of hours in a year (since savings are assumed to be constant over year
	= 8766
3412	= Conversion from Btu to kWh
RE_electric	= Recovery efficiency of electric hot water heater
	= 0.98 ²¹⁰

A deemed savings assumption for single family homes, where site-specific inputs are not available, would be as follows:

 ΔkWh = (0.083 * 24.99 * (135 - 120) * 8766) / (3412 * 0.98)

= 81.6 kWh

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \frac{\Delta kWh}{Hours} * CF$$

Where:

CF

Hours = 8766

= Summer Peak Coincidence Factor for measure

= 1

²⁰⁹ Assumptions from Pennsylvania Public Utility Commission Technical Reference Manual; (<u>http://www.puc.pa.gov/filing_resources/issues_laws_regulations/act_129_information/technical_reference_manual.aspx</u>). Area values were calculated from average dimensions of several commercially available units, with radius values measured to the center of the insulation.

²¹⁰ Electric water heaters have recovery efficiency of 98%: <u>https://www.ahridirectory.org/Search/SearchHome</u>

Iowa Energy Efficiency Statewide Technical Reference Manual—2.3.3 Water Heater Temperature Setback

A deemed savings assumption, where site-specific inputs are not available, would be as follows:

 ΔkW = (81.6/8766) * 1 = 0.0093 kW

NATURAL GAS SAVINGS

For homes with gas water heaters:

$$\Delta Therms = \frac{U * A * (Tpre - Tpost) * Hours}{100,000 * RE_gas}$$

Where

100,000	= Converts Btus to Therms (Btu/Therm)
RE_gas	= Recovery efficiency of gas water heater
	= Actual if known - if not, assume:
	= 78% For SF homes ²¹¹
	= 60% For MF homes with DHW from central boiler
	= 78% for MF homes with dedicated gas DHW system

A deemed savings assumption, where site-specific inputs are not available, would be as follows:

For Single Family homes or multifamily homes with dedicated gas DHW system:

ΔTherms = (0.083 * 24.99 * (135 – 120) * 8766) / (100,000 * 0.78) = 3.5 Therms

An example for multifamily homes with DHW from a central boiler is provided below (tank capacity can vary considerably so actual values should be used). This example assumes a 119 gallon tank with a surface area of 47.80ft²:

ΔTherms = (0.083 * 47.80 * (135 – 120) * 8766) / (100,000 * 0.60) = 8.7 Therms

PEAK GAS SAVINGS

 $\Delta PeakTherms = \Delta Therms * GCF$

Where:

ΔTherms	= Therm impact calculated above
GCF	= Gas Coincidence Factor for Water Heating
	= 0.002952 for Residential Water Heating

A deemed savings assumption, where site-specific inputs are not available, would be as follows:

For Single Family homes or multifamily homes with dedicated gas DHW system:

²¹¹ DOE Final Rule discusses Recovery Efficiency with an average around 0.76 for Gas Fired Storage Water heaters and 0.78 for standard efficiency gas fired tankless water heaters up to 0.95 for the highest efficiency gas fired condensing tankless water heaters. These numbers represent the range of new units however, not the range of existing units in stock. Review of AHRI Directory suggests range of recovery efficiency ratings for new Gas DHW units of 70-87%. Average of existing units is estimated at 78%.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.3.3 Water Heater Temperature Setback

 $\Delta PeakTherms = 3.5 * 0.002952$

= 0.0103 Therms

An example for multifamily homes with DHW from a central boiler is provided below (tank capacity can vary considerably so actual values should be used). This example assumes a 119 gallon tank with a surface area of 47.80ft²:

ΔPeakTherms = 8.7 * 0.002952

= 0.0257 Therms

SUNSET DATE: 1/1/2023

Iowa Energy Efficiency Statewide Technical Reference Manual-2.3.4 Low Flow Faucet Aerators

2.3.4 Low Flow Faucet Aerators

DESCRIPTION

This measure relates to the installation of a low flow faucet aerator in a single family home or multifamily unit in unit kitchen or bathroom faucet fixture.

This measure was developed to be applicable to the following program types: TOS, NC, RF, DI, KITS.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a low flow faucet aerator, rated at 1.5 gallons per minute (GPM) ²¹² or less. Savings are calculated on an average savings per faucet fixture basis.

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is assumed to be a standard faucet aerator rated at 2.2 GPM²¹³ or greater.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 10 years.²¹⁴

DEEMED MEASURE COST

For RF and DI, the incremental cost for this measure is \$16 or program actual.²¹⁵

For TOS and NC, the incremental cost is \$0.216

For faucet aerators provided in Efficiency Kits, the actual program delivery costs should be used.

LOADSHAPE

Loadshape RE12 – Residential Single Family Water Heat

Loadshape RE04 – Residential Multifamily Water Heat

Loadshape RG07 - Residential Water Heat (gas)

(http://www1.eere.energy.gov/femp/technologies/eep_faucets_showerheads_calc.html#output)

²¹² IPL program product data for 2014 Iowa Residential Energy Assessments.

²¹³ DOE Energy Cost Calculator for Faucets and Showerheads:

²¹⁴ 2014 Database for Energy-Efficiency Resources (DEER), Version 2014, "Cost Values and Summary Documentation," California Public Utilities Commission, January, 2014. "

²¹⁵ Direct-install price per faucet assumes cost of aerator and install time. (2011, Market research average of \$3 and assess and install time of \$13(20min @ \$40/hr).

²¹⁶ Based on VEIC's market research of the lower 10th percentile of product categories, which is assumed to filter out price differences related to product quality and features, the incremental cost difference between a baseline and low-flow aerator is negligible.

Iowa Energy Efficiency Statewide Technical Reference Manual -2.3.4 Low Flow Faucet Aerators

```
Algorithm
```

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

Note these savings are per faucet retrofitted (unless faucet type is unknown, then it is per household).²¹⁷

 $\Delta kWh = \& ElectricDHW * ((GPM_base - GPM_low) * L * Household * 365.25 * \frac{DF}{FPH}) * EPG_electric * ISR$

Where:

L

%ElectricDHW = proportion of water heating supplied by electric resistance heating

DHW fuel	%ElectricDHW
Electric	100%
Natural Gas	0%
Unknown	30% ²¹⁸

GPM_base = Average flow rate, in gallons per minute, of the baseline faucet "as-used"

= Measured full throttle flow * 0.83 throttling factor²¹⁹

If flow not measured, assume (2.2 * 0.83) = 1.83 GPM

GPM_low = Average flow rate, in gallons per minute, of the low-flow faucet aerator "as-used"

= Rated full throttle flow * 0.95 throttling factor²²⁰

If flow not available, assume (1.5 * 0.95) = 1.43 GPM

= Average daily length faucet use per capita for faucet of interest in minutes

= if available, custom based on metering studies - if not, use:

Faucet Type	L (min/person/day)
Kitchen	4.5 ²²¹
Bathroom	1.6 ²²²
If location unknown (total for	9.0 ²²³

²¹⁷ This algorithm calculates the amount of energy saved per aerator by determining the fraction of water consumption savings for the upgraded fixture.

²¹⁸ Default assumption for unknown fuel is based on Dunsky and Opinion Dynamics Baseline Study results. If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area then that should be used

²²⁴ One kitchen faucet plus 1.5 bathroom faucets. Based on findings from a 2009 ComEd, Illinois residential survey of 140 sites, provided by Cadmus.

²²⁵ Average household size from U.S. Census Bureau, 2013-2017 American Community Survey 5-Year Estimates for Iowa (Table DP04). Single-family household size based on owner-occupied estimate and multifamily household size based on renter-occupied estimate.

²²⁶ Bedrooms are suitable proxies for household occupancy, and may be preferable to actual occupancy due to turnover rates in residency and non-adult population impacts.

²²⁷ Because faucet usages are at times dictated by volume, only usage of the sort that would go straight down the drain will provide savings. VEIC is unaware of any metering study that has determined this specific factor and so through consensus with the Illinois Technical Advisory Group have deemed these values to be 75% for the kitchen and 90% for the bathroom. If the aerator location is unknown, an average of 79.5% should be used, which is based on the assumption that 70% of household water runs through the kitchen faucet and 30% through the bathroom (0.7*0.75)+(0.3*0.9)=0.795.

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.3.4 Low Flow Faucet Aerators

iter
= Specific weight of water (lbs/gallon)
= 8.33 lbs/gallon
= Heat Capacity of water (Btu/lb-°F)
= Assumed temperature of mixed water
= 86F for Bath, 93F for Kitchen 91F for Unknown ²²⁸
= Assumed temperature of water entering house
= 56.5 ²²⁹
= Average Recovery efficiency of electric water heater
= 98% ²³⁰ for electric resistance (or unknown)
= 200% ²³¹ for heat pump water heaters
= Converts Btu to kWh (Btu/kWh)

ISR

= In service rate of faucet aerators

Program	ISR

²²⁸ Cadmus and Opinion Dynamics Showerhead and Faucet Aerator Meter Study Memorandum dated June 2013, directed to Michigan Evaluation Working Group. If the aerator location is unknown, an average of 91F should be used, which is based on the assumption that 70% of household water runs through the kitchen faucet and 30% through the bathroom: (0.7*93)+(0.3*86)=0.91.

²²⁹ Averaged monthly water main temperature calculated using the methodology provided in Building America Research Benchmark Definition, updated December 2009. Pg.19-20. <u>http://www.nrel.gov/docs/fy10osti/47246.pdf</u>; water main temperature represents the average of TMY3 data from all Class I stations located in Des Moines, IA.

²³⁰ Electric water heaters have recovery efficiency of 98%: <u>https://www.ahridirectory.org/Search/SearchHome</u>

²³¹ 200% represents a reasonable estimate of the weighted average event recovery efficiency for heat pump water heaters, including those that are set to Heat Pump only mode (and so have a recovery efficiency >250%) and those that are set in hybrid mode where a larger draw would kick the unit in to resistance mode (98%), or where low total water consumption can result in lower COPs due to relatively high standby losses. Note that the AHRI directory provides recovery efficiency ratings, some of which are >250% but most are rated at 100%. This is due to the rating test involving a large hot water draw, consistent with multiple showers.

²³² ComEd Energy Efficiency/ Demand Response Plan: Plan Year 2 (6/1/2009-5/31/2010) Evaluation Report: All Electric Single Family Home Energy Performance Tune-Up Program Table 3-8.

²³³ Based on Cadmus, "Final Report: Iowa 2015 Energy Wise Program", January 29, 2016, p16.. Unknown is average of kitchen and bathroom installations.

²³⁴ Based on results provided in "School-based interim process memo_Final_100215.doc".

²³⁹ See 'Calculation of GPH Recovery_03282018.xls' for calculation details.

²⁴⁰ Calculated as follows: Assume 18% aerator use takes place during peak hours (based on: Deoreo, B., and P. Mayer. "The End Uses of Hot Water in Single Family Homes from Flow Trace Analysis", 2001_) There are 65 days in the summer peak period, so the percentage of total annual aerator use in peak period is 0.18*65/365.25 = 3.20%. The number of hours of recovery during peak periods is therefore assumed to be 3.20% *142 = 4.5 hours of recovery during peak period, where 142 equals the average annual electric DHW recovery hours for faucet use in SF homes. There are 260 hours in the peak period, so the probability you will see savings during the peak period is 4.5/260 = 0.017.

²⁴² DOE Final Rule discusses Recovery Efficiency with an average around 0.76 for Gas Fired Storage Water heaters and 0.78 for standard efficiency gas fired tankless water heaters up to 0.95 for the highest efficiency gas fired condensing tankless water heaters. These numbers represent the range of new units however, not the range of existing units in stock. Review of AHRI Directory suggests range of recovery efficiency ratings for new Gas DHW units of 70-87%. Average of existing units is estimated at 78%.

²⁴³ Water heating in multi-family buildings is often provided by a larger central boiler. An average efficiency of 0.69 is used for this analysis as a default for multi-family buildings where water heating system is unknown.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.3.4 Low Flow Faucet Aerators

MEASURE CODE: RS-HWE-LFFA-V04-200101

SUNSET DATE: 1/1/2023

Iowa Energy Efficiency Statewide Technical Reference Manual-2.3.5 Low Flow Showerheads

2.3.5 Low Flow Showerheads

DESCRIPTION

This measure relates to the installation of a low flow showerhead in a single or multifamily household.

This measure was developed to be applicable to the following program types: TOS, NC, DI, KITS.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a low flow showerhead rated at 1.5 gallons per minute (GPM) or less. Savings are calculated on a per showerhead fixture basis.

DEFINITION OF BASELINE EQUIPMENT

For direct-install programs, the baseline condition is assumed to be a standard showerhead rated at 2.5 GPM or greater.

For time-of-sale programs, the baseline condition is assumed to be a representative average of existing showerhead flow rates of participating customers including a range of low flow showerheads, standard-flow showerheads, and high-flow showerheads.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 10 years.²⁴⁴

DEEMED MEASURE COST

For direct install programs, actual full installed costs should be used where available. If actual costs are unavailable, assume a full installed cost of \$42.22.²⁴⁵

For time of sale or new construction, actual incremental costs may be used (assume a baseline showerhead material cost of \$14.32).²⁴⁶ If actual costs are unavailable, assume an incremental cost of \$14.90.²⁴⁷

For low flow showerheads provided in Efficiency Kits, the actual program delivery costs should be used.

LOADSHAPE

Loadshape RE12 – Residential Single Family Water Heat

Loadshape RE04 – Residential Multifamily Water Heat

Loadshape RG07 – Residential Water Heat (gas)

²⁴⁴

²⁰¹⁴ Database for Energy-Efficiency Resources (DEER), Version 2014, "Cost Values and Summary Documentation," California Public Utilities Commission, January, 2014. "

²⁴⁵Direct-install price per showerhead assumes cost of showerhead (\$29.22 from the California DEER Ex Ante Database) and install time of \$13 (20min @ \$40/hr).

²⁴⁶ Cost of standard showerhead from California DEER Ex Ante Database.

²⁴⁷ Incremental cost from California DEER Ex Ante Database.

Iowa Energy Efficiency Statewide Technical Reference Manual -2.3.5 Low Flow Showerheads

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

Note: these savings are per showerhead fixture

$$\Delta kWh = \% ElectricDHW * (GPM_base - GPM_low) * L * Household * SPCD * \frac{365.25}{SPH}$$

* EPG_electric * ISR

Where:

%ElectricDHW = proportion of water heating supplied by electric resistance heating

DHW fuel	%ElectricDHW
Electric	100%
Natural Gas	0%
Unknown	30% ²⁴⁸

GPM_base = Flow rate of the baseline showerhead

= Actual measured flow rate. If not measured assume:

Program	GPM_base	
Direct-install	2.5 ²⁴⁹	
Retrofit, Efficiency Kits, NC, or TOS	2.35 ²⁵⁰	

GPM low = Flow rate of the low-flow showerhead:

= Actual measured flow rate. If not measured, assume 1.5GPM

= Shower length in minutes with showerhead

= 7.8 min²⁵¹

Household

L

```
= Average number of people per household
```

Household Unit Type	Household ²⁵²
Single-Family - Deemed	2.51
Multifamily - Deemed	2.18

²⁴⁸ Default assumption for unknown fuel is based on Dunsky and Opinion Dynamics Baseline Study results. If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area then that should be used

265 25

²⁴⁹ The Energy Policy Act of 1992 (EPAct) established the maximum flow rate for showerheads at 2.5 gallons per minute (gpm). ²⁵⁰ Representative value from sources 1, 2, 4, 5, 6, and 7 (See Source Table at end of measure section) adjusted slightly upward to account for program participation which is expected to target customers with existing higher flow devices rather than those with existing low flow devices.

²⁵¹ Cadmus and Opinion Dynamics Showerhead and Faucet Aerator Meter Study Memorandum dated June 2013, directed to Michigan Evaluation Working Group. This study of 135 single and multi-family homes in Michigan metered energy parameters for efficient showerhead and faucet aerators.

²⁵² Average household size from U.S. Census Bureau, 2013-2017 American Community Survey 5-Year Estimates for Iowa (Table DP04). Single-family household size based on owner-occupied estimate and multifamily household size based on renteroccupied estimate. .

Iowa Energy Efficiency Statewide Technical Reference Manual-2.3.5 Low Flow Showerheads

Household Unit Type	Household ²⁵²	
Custom	Actual Occupancy or Number of Bedrooms ²⁵³	

SPCD = Showers Per Capita Per Day

= 0.6²⁵⁴

365.25 = Days per year, on average

SPH = Showerheads Per Household so that per-showerhead savings fractions can be determined

Household Unit Type	SPH
Single-Family	1.79 ²⁵⁵
Multifamily	1.3 ²⁵⁶
Custom	Actual

EPG_electric = Energy per gallon of hot water supplied by electric

= (γWater * 1.0 * (ShowerTemp - SupplyTemp)) / (RE_electric * 3412)

= 0.1109 kWh/gal for resistance (or unknown) unit, 0.0543 kWh/gal for heat pump water heaters

Where:

γWater	= Specific weight of water (lbs/gallon)		
	= 8.33 lbs/gallon		
1.0	= Heat Capacity of water (Btu/lb-°)		
ShowerTemp	= Assumed temperature of water		
	= 101F ²⁵⁷		
SupplyTemp	= Assumed temperature of water entering house		
	= 56.5 ²⁵⁸		
RE_electric	= Average Recovery efficiency of electric water heater		
	= 98% ²⁵⁹ for electric resistance (or unknown)		
	= 200% ²⁶⁰ for heat pump water heaters		

²⁵³ Bedrooms are suitable proxies for household occupancy, and may be preferable to actual occupancy due to turnover rates in residency and non-adult population impacts.

²⁵⁶ 2009 ComEd residential survey of 140 sites, provided by Cadmus.

²⁵⁹ Electric water heaters have recovery efficiency of 98%: <u>https://www.ahridirectory.org/Search/SearchHome</u>

²⁵⁴ Cadmus and Opinion Dynamics Showerhead and Faucet Aerator Meter Study Memorandum dated June 2013, directed to Michigan Evaluation Working Group.

²⁵⁵ Based on findings from a 2009 ComEd residential survey of 140 sites, provided by Cadmus.

²⁵⁷ Cadmus and Opinion Dynamics Showerhead and Faucet Aerator Meter Study Memorandum dated June 2013, directed to Michigan Evaluation Working Group.

²⁵⁸ Averaged monthly water main temperature calculated using the methodology provided in Building America Research Benchmark Definition, updated December 2009. Pg.19-20. <u>http://www.nrel.gov/docs/fy10osti/47246.pdf</u>; water main temperature represents the average of TMY3 data from all Class I stations located in Des Moines, IA.

²⁶⁰ 200% represents a reasonable estimate of the weighted average event recovery efficiency for heat pump water heaters, including those that are set to Heat Pump only mode (and so have a recovery efficiency >250%) and those that are set in hybrid

Iowa Energy Efficiency Statewide Technical Reference Manual-2.3.5 Low Flow Showerheads

3412 = Converts Btu to kWh (Btu/kWh)

ISR

= In service rate of showerhead

mode where a larger draw would kick the unit in to resistance mode (98%), or where low total water consumption can result in lower COPs due to relatively high standby losses. Note that the AHRI directory provides recovery efficiency ratings, some of which are >250% but most are rated at 100%. This is due to the rating test involving a large hot water draw, consistent with multiple showers.

²⁶¹ Deemed values are from ComEd Illinois Energy Efficiency/ Demand Response Plan: Plan Year 2 (6/1/2009-5/31/2010) Evaluation Report: All Electric Single Family Home Energy Performance Tune-Up Program Table 3-8. Alternative ISRs may be developed for program delivery methods based on evaluation results.

(Schools)	Multifamily Electric Resistance DHW	= 116.3/215.9* 0.016	0.0086

²⁶⁶ See 'Calculation of GPH Recovery_06122019.xls' for calculation details.

²⁶⁷ Calculated as follows: Assume 11% showers take place during peak hours (based on: Deoreo, B., and P. Mayer. "The End Uses of Hot Water in Single Family Homes from Flow Trace Analysis", 2001). There are 65 days in the summer peak period, so the percentage of total annual aerator use in peak period is 0.11*65/365.25 = 1.96%. The number of hours of recovery during peak periods is therefore assumed to be 1.96% * 216 = 4.23 hours of recovery during peak period, where 216 equals the average annual electric DHW recovery hours for showerhead use in SF homes with Direct Install and Retrofit/TOS measures. There are 260 hours in the peak period, so the probability you will see savings during the peak period is 4.23/260 = 0.016.

NATURAL GAS SAVINGS

 $\Delta Therms = \% FossilDHW * ((GPM_base - GPM_low) * L * Household * SPCD * \frac{365.25}{SPH}) * EPG_gas * ISR$

Where:

%FossilDHW

HW = proportion of water heating supplied by Natural Gas heating

DHW fuel	%Fossil_DHW
Electric	0%
Fossil Fuel	100%
Unknown	70% ²⁶⁸

EPG_gas = Energy per gallon of hot water supplied by gas

= (γWater * 1.0 * (ShowerTemp - SupplyTemp)) / (RE_gas * 100,000)

= 0.00475 Therm/gal for SF or MF homes with storage tanks

= 0.00626 Therm/gal for MF homes with central boiler DHW, 0.00535 Therm/gal for MF homes with unknown DHW

Where:

RE_gas	= Recovery efficiency of gas water heater
	= 78% For SF homes ²⁶⁹
	= 78% for MF homes with storage tank, 59% if hot water through central boiler or 69% if unknown ²⁷⁰
100,000	= Converts Btus to Therms (Btu/Therm)
	Other variables as defined above.

Program	Market	Algorithm	ΔTherms
Direct Install Direct Install Singl Unkr Mult Stora Mult	Single Family Gas DHW	= 1.0 * ((2.5 - 1.5) * 7.8 * 2.51 * 0.6 * 365.25 / 1.79) * 0.00475 * 0.98	11.2
	Single Family Unknown DHW	= 0.70 * ((2.5 - 1.5) * 7.8 * 2.51 * 0.6 * 365.25 / 1.79) * 0.00475 * 0.98	7.8
	Multifamily Gas Storage DHW	= 1.0 * ((2.5 - 1.5) * 7.8 * 2.18 * 0.6 * 365.25 / 1.3) * 0.00475 * 0.98	13.3
	Multifamily Gas Central Boiler DHW	= 1.0 * ((2.5 - 1.5) * 7.8 * 2.18 * 0.6 * 365.25 / 1.3) * 0.00626 * 0.98	17.6

²⁶⁸ Default assumption for unknown fuel is based on Dunsky and Opinion Dynamics Baseline Study results. If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area, then they should be used.

²⁶⁹ Review of AHRI Directory suggests range of recovery efficiency ratings for new Gas DHW units of 70-87%. Average of existing units is estimated at 78%.

²⁷⁰ Water heating in multifamily buildings is often provided by a larger central boiler. An average efficiency of 0.69 is used for this analysis as a default for multifamily buildings where the water heating system is unknown.

Iowa Energy Efficiency Statewide Technical Reference Manual-2.3.6 Domestic Hot Water Pipe Insulation

2.3.6 Domestic Hot Water Pipe Insulation

DESCRIPTION

This measure applies to the addition of insulation to uninsulated domestic hot water pipes. The measure assumes the pipe wrap is installed on the first length of both the hot and cold pipe up to the first elbow. This is the most cost effective section to insulate since the water pipes act as an extension of the hot water tank up to the first elbow, which acts as a heat trap. Insulating this length therefore helps reduce standby losses.

This measure was developed to be applicable to the following program types: DI, RF.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient condition is a domestic hot or cold water pipe with pipe wrap installed that has an R value that meets program requirements.

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is an uninsulated, domestic hot or cold water pipe.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 12 years.²⁷¹

DEEMED MEASURE COST

The measure cost is the actual cost of material and installation. If the actual cost is unknown, assume a default cost of \$4 per linear foot,²⁷² including material and installation.

LOADSHAPE

Loadshape E01 – Flat

Loadshape G01 – Flat

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

Custom calculation below for electric domestic hot water (DHW) systems, otherwise assume 24.7 kWh per 6 linear feet of ¾ in, R-4 insulation or 35.5 kWh per 6 linear feet of 1 in, R-6 insulation:

$$\Delta kWh = ((C_{Base}/R_{Base} - C_{EE}/R_{EE}) * L * \Delta T * Hours)/(\eta DHW_{Elec} * 3,412)$$

Where:

 C_{Base}

= Circumference (ft) of uninsulated pipe

= Diameter (in) * $\pi/12$ (pipe with 0.50 in diameter = 0.131 ft, pipe with 0.75 in diameter

= 0.196 ft)

 ²⁷¹ 2014 Database for Energy-Efficiency Resources (DEER), Version 2014, "Cost Values and Summary Documentation", California Public Utilities Commission, January, 2014. Average of values for electric DHW (13 years) and gas DHW (11 years).
 ²⁷² Consistent with DEEP 2008 Massure Cost Summary, Povised June 2, 2008 (www.docrosources.com).

²⁷² Consistent with DEER 2008 Measure Cost Summary, Revised June 2, 2008 (www.deeresources.com).

Iowa Energy Efficiency Statewide Technical Reference Manual -2.3.6 Domestic Hot Water Pipe Insulation

	= Actual or if unknown, assume 0.131 ft
R _{Base}	= Thermal resistance coefficient (hr-°F-ft ²)/Btu) of uninsulated pipe
	$= 1.0^{273}$
C _{EE}	= Circumference (ft) of insulated pipe
	= Diameter (in) * $\pi/12$
	= Actual or if unknown, assume 0.524 ft for a 0.50 in diameter pipe insulated with 3/4 in, R-4 wrap ((0.5 + 3/4 + 3/4) * π /12) or 0.654 ft for a 0.50 in diameter pipe insulated with 1 in, R-6 wrap ((0.5 + 1 + 1) * π /12) ²⁷⁴
R _{EE}	= Thermal resistance coefficient (hr-°F-ft ²)/Btu) of insulated pipe
	= 1.0 + R value of insulation
	= Actual or if unknown, assume 5.0 for R-4 wrap or 7.0 for R-6 wrap
L	= Length of pipe from water heating source covered by pipe wrap (ft)
	= Actual or if unknown, assume 6 ft
ΔΤ	= Average temperature difference (°F) between supplied water and outside air
	= Actual or if unknown, assume 60°F ²⁷⁵
Hours	= Hours per year
	= 8,766
ηDHW_{Elec}	= Recovery efficiency of electric hot water heater
	= Actual or if unknown, assume 0.98 ²⁷⁶
3,412	= Conversion factor from Btu to kWh

For example, an electric DHW pipe with 6 feet of ¾ in, R-4 insulation installed, with defaults from above, would save:

$$\begin{split} \Delta k W h &= ((C_{Base}/R_{Base} - C_{EE}/R_{EE}) * L * \Delta T * Hours) / (\eta DHW_{Elec} * 3,412) \\ &= ((0.131/1.0 - 0.524/5.0) * 6 * 60 * 8,766) / (0.98 * 3,412) \\ &= 24.7 \ k W h \end{split}$$

SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWh/Hours$

Where:

 ΔkWh = Electric energy savings from pipe wrap installation

Other variables as defined above.

²⁷³ Navigant Consulting Inc., April 2009; "Measures and Assumptions for Demand Side Management (DSM) Planning; Appendix C Substantiation Sheets", p77.

²⁷⁴ Pipe wrap thicknesses based on review of available products on Grainger.com

²⁷⁵ Assumes 125°F water leaving the hot water tank and average temperature of basement of 65°F.

²⁷⁶ Electric water heaters have recovery efficiency of 98%: <u>https://www.ahridirectory.org/Search/SearchHome</u>

Iowa Energy Efficiency Statewide Technical Reference Manual—2.3.6 Domestic Hot Water Pipe Insulation

For example, an electric DHW pipe with 6 feet of ¾ in, R-4 insulation installed, with defaults from above, would save:

ΔkW = 24.7/8,766 = 0.0028 kW

NATURAL GAS SAVINGS

Custom calculation below for gas DHW systems, otherwise assume 1.1 therms per 6 linear feet of $\frac{3}{10}$ in, R-4 insulation or 1.5 therms per 6 linear feet of 1 in, R-6 insulation:

 $\Delta Therms = ((C_{Base}/R_{Base} - C_{EE}/R_{EE}) * L * \Delta T * Hours)/(\eta DHW_{Gas} * 100,000)$

Where:

ηDHW_{Gas} = Recovery efficiency of gas hot water heater
 = 0.78²⁷⁷
 100,000 = Conversion factor from Btu to therms

Other variables as defined above

For example, a gas DHW pipe with 6 feet of $\frac{3}{4}$ in, R-4 insulation installed, with defaults from above, would save: $\Delta Therms = ((C_{Base}/R_{Base} - C_{EE}/R_{EE}) * L * \Delta T * Hours) / (\eta DHW_{Gas} * 100,000)$ = ((0.131/1.0 - 0.524/5.0) * 6 * 60 * 8,766) / (0.78 * 100,000) = 1.1 therms

PEAK GAS SAVINGS

Savings for this measure are assumed to be evenly spread across the year.

 $\Delta PeakTherms = \Delta Therms/365.25$

Where:

Δ Therms	= Gas savings from pipe wrap insulation
365.25	= Number of days per year

For example, a gas DHW pipe with 6 feet of $\frac{3}{4}$ in, R-4 insulation installed, with defaults from above, would save: $\Delta PeakTherms = 1.1/365.25$ = 0.0030 therms

SUNSET DATE: 1/1/2023

Iowa Energy Efficiency Statewide Technical Reference Manual—2.3.7 Water Heater Wrap

2.3.7 Water Heater Wrap

DESCRIPTION

This measure applies to a tank wrap or insulation "blanket" that is wrapped around the outside of an electric or gas domestic hot water (DHW) tank to reduce stand-by losses.

This measure was developed to be applicable to the following program types: DI, RF.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient condition is an electric or gas DHW tank with wrap installed that has an R-value that meets program requirements.

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is an uninsulated, electric or gas DHW tank.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life is assumed to be 7 years.²⁷⁸

DEEMED MEASURE COST

The measure cost is the actual cost of material and installation. If actual costs are unknown, assume \$58 for material and installation.²⁷⁹

LOADSHAPE

Loadshape G01 – Flat

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

Custom calculation below for electric DHW tanks, otherwise use default values from table that follows:

$$\Delta kWh = \left((A_{Base}/R_{Base} - A_{EE}/R_{EE}) * \Delta T * Hours \right) / (\eta DHW_{Elec} * 3,412)$$

Where:

A _{Base}	e = Surface area (ft ²) of storage tank prior to adding tank wrap ²⁸⁰		
	= Actual or if unknown, use default based on tank capacity (gal) from table below		
R _{Base}	= Thermal resistance coefficient (hr-°F-ft ² /BTU) of uninsulated tank		
	= Actual or if unknown, assume 14 ²⁸¹		

 ²⁷⁸ 2014 Database for Energy-Efficiency Resources (DEER), Version 2014, "Cost Values and Summary Documentation", California Public Utilities Commission, January, 2014. Average of values for electric DHW (13 years) and gas DHW (11 years).
 ²⁷⁹ Average cost of R-10 tank wrap installation from the National Renewable Energy Laboratory's National Residential Efficiency

²⁷³ Average cost of R-10 tank wrap installation from the National Renewable Energy Laboratory's National Residential Efficiency Measures Database. <u>http://www.nrel.gov/ap/retrofits/measures.cfm?gld=6&ctld=270</u>

²⁸⁰ Area includes tank sides and top to account for typical wrap coverage.

²⁸¹ Baseline R-value based on information from Chapter 6 of The Virginia Energy Savers Handbook, Third Edition: The best

Iowa Energy Efficiency Statewide Technical Reference Manual—2.3.7 Water Heater Wrap

Aee	= Surface area (ft ²) of storage tank after addition of tank wrap ²⁸²
	= Actual or if unknown, use default based on tank capacity (gal) from table below
R _{EE}	= Thermal resistance coefficient ((hr-°F-ft2/BTU) of tank after addition of tank wrap (R- value of uninsulated tank + R-value of tank wrap)
	= Actual or if unknown, assume 24
ΔΤ	= Average temperature difference (°F) between tank water and outside air
	= Actual or if unknown, assume 60°F ²⁸³
Hours	= Hours per year
	= 8,766
ηDHW_{Elec}	= Recovery efficiency of electric hot water heater
	= Actual or if unknown, assume 0.98 ²⁸⁴
3,412	= Conversion from Btu to kWh
 owing table conta	ing default equippe for vertices tools appearing

The following table contains default savings for various tank capacities.

Capacity (gal)	A _{Base} (ft ²) ²⁸⁵	A _{EE} (ft ²) ²⁸⁶	∆kWh	ΔkW
30	19.16	20.94	78.0	0.0089
40	23.18	25.31	94.6	0.0108
50	24.99	27.06	103.4	0.0118
80	31.84	34.14	134.0	0.0153

For example, a 30 gallon electric DHW tank with an R-value of 14 before insulation is installed and an R-value of 24 after insulation is installed, with defaults from above, would save:

 $\Delta kWh = ((A_{Base}/R_{Base} - A_{EE}/R_{EE}) * \Delta T * Hours) / (\eta DHW_{Elec} * 3,412)$ = ((19.16/14 - 20.94/24) * 60 * 8,766) / (0.98 * 3,412)

= 78.0 kWh

SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \Delta kWh/Hours$

Where:

 ΔkWh = Electric energy savings from tank wrap installation

Other variables as defined above

The table above contains default kW savings for various tank capacity and pre and post R-values.

heaters have 2 to 3 inches of urethane foam, providing R-values as high as R-20. Other less expensive models have fiberglass tank insulation with R-values ranging between R-7 and R-10.

²⁸² Area includes tank sides and top to account for typical wrap coverage.

²⁸³ Assumes 125°F hot water tank temperature and average temperature of basement of 65°F.

²⁸⁴ Electric water heaters have recovery efficiency of 98%: <u>https://www.ahridirectory.org/Search/SearchHome</u>

²⁸⁵ Assumptions from PA TRM. Area values were calculated from average dimensions of several commercially available units, with radius values measured to the center of the insulation. Area includes tank sides and top to account for typical wrap coverage.

²⁸⁶ Assumptions from PA TRM. A_{EE} was calculated by assuming that the water heater wrap is a 2" thick fiberglass material.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.3.7 Water Heater Wrap

For example, a 30 gallon electric DHW tank with an R-value of 14 before insulation is installed and an R-value of 24 after insulation is installed, with defaults from above, would save:

ΔkW = 78.0/8,766

= 0.0089 kW

NATURAL GAS SAVINGS

Custom calculation below for gas DHW tanks, otherwise use default values from table that follows:

 $\Delta Therms = ((A_{Base}/R_{Base} - A_{EE}/R_{EE}) * \Delta T * Hours)/(\eta DHW_{Gas} * 100,000)$

Where:

ηDHW_{Gas} = Recovery efficiency of gas hot water heater
 = 0.78²⁸⁷
 100,000 = Conversion factor from Btu to therms

Other variables as defined above

The following table contains default savings for various tank capacities.

Capacity (gal)	A _{Base} (ft ²) ²⁸⁸	A _{EE} (ft ²) ²⁸⁹	ΔTherms	ΔPeakTherms
30	19.16	20.94	3.3	0.0092
40	23.18	25.31	4.1	0.0111
50	24.99	27.06	4.4	0.0121
80	31.84	34.14	5.7	0.0157

For example, a 30 gallon gas DHW tank with an R-value of 14 before insulation is installed and an R-value of 24 after insulation is installed, with defaults from above, would save:

 $\Delta Therms = ((A_{Base}/R_{Base} - A_{EE}/R_{EE}) * \Delta T * Hours) / (\eta DHW_{Gas} * 100,000)$

= ((19.16/14 - 20.94/24) * 60 * 8,766) / (0.78 * 100,000)

= 3.3 therms

PEAK GAS SAVINGS

Savings for this measure are assumed to be evenly spread across the year.

$$\Delta PeakTherms = \frac{\Delta Therms}{365.25}$$

Where:

 Δ Therms = Gas savings from tanks wrap insulation

365.25 = Number of days per year

The table above contains default Peak Therm savings for various tank capacity and pre and post R-values.

²⁸⁷ Review of AHRI Directory suggests range of recovery efficiency ratings for new Gas DHW units of 70-87%. Average of existing units is estimated at 78%

²⁸⁸ Assumptions from PA TRM. Area values were calculated from average dimensions of several commercially available units, with radius values measured to the center of the insulation. Area includes tank sides and top to account for typical wrap coverage.

²⁸⁹ Assumptions from PA TRM. A_{EE} was calculated by assuming that the water heater wrap is a 2" thick fiberglass material.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.3.7 Water Heater Wrap

For example, a 30 gallon gas DHW tank with an R-value of 14 before installation is installed and an R-value of 24 after installation is installed, with defaults from above, would save:

 $\Delta PeakTherms = 3.3/365.25$

= 0.0092 therms

MEASURE CODE: RS-HWE-WRAP-V01-170101

SUNSET DATE: 1/1/2023

2.4 Heating, Ventilation, and Air Conditioning (HVAC)

2.4.1 Central Air Source Heat Pump

DESCRIPTION

A heat pump provides heating or cooling by moving heat between indoor and outdoor air.

This measure characterizes:

- a) Time of Sale:
 - i. The installation of a new residential sized (≤ 65,000 Btu/hr) central air source heat pump that is more efficient than required by federal standards. This could relate to the replacement of an existing unit at the end of its useful life, or the installation of a new system in a new home.
- b) Early Replacement:
 - i. The early removal of functioning electric heating and cooling (if present) systems from service, prior to the natural end of life, and replacement with a new high efficiency central air source heat pump unit. Savings are calculated between existing unit and efficient unit consumption during the remaining life of the existing unit, and between new baseline unit and efficient unit consumption for the remainder of the measure life.
 - ii. In order to apply Early Replacement savings, the existing unit must be functioning and SEER ≤10. "Functioning" is defined as being fully operational – providing sufficient space conditioning (i.e., heat exchanger, compressors, pumps work effectively) and/or the cost of repair is under 20% of the new baseline replacement cost. Therefore, in order to apply early replacement assumptions, the programs should apply the following eligibility criteria: SEER ≤10 and cost of any repairs <\$471 per ton.</p>

Quality Installation:

Additional savings are attributed to the Quality Installation (QI) of the system. QI programs should follow industry standards such as those described in ANSI ACCA QI5 and QI9vp. This must include considerations of system design (including sizing, matching, ventilation calculations) and equipment installation (including static pressure, airflow, refrigerant charge) and may also consider distribution.

This measure was developed to be applicable to the following program types: TOS, NC, EREP.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

A new residential sized (\leq 65,000 Btu/hr) central air source heat pump with specifications to be determined by program.

DEFINITION OF BASELINE EQUIPMENT

Time of Sale: The baseline is a new residential sized (\leq 65,000 Btu/hr) central air source heat pump meeting federal standards. The current Federal Standard efficiency level as of January 1, 2015 is 14 SEER and 8.2HSPF but for calculating savings the average of non-ENERGY STAR available product is used: 14.4 SEER, 11.8 EER and 8.2HSPF.²⁹⁰ It is assumed that 'Quality Installation' did not occur.

Early replacement: The baseline is the efficiency of the existing equipment for the assumed remaining useful life of the unit and the new baseline as defined above for the remainder of the measure life.

²⁹⁰ Based on review of available models on AHRI directory on 04/19/2017. See 'CAC and ASHP AHRI average_04262017.xls'.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.1 Central Air Source Heat Pump

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected equipment measure life is assumed to be 18 years.²⁹¹ Quality installation savings are assumed to last the time of the equipment because they come from the selection of fans and ducts, as well as airflow and other settings that do not change through normal operation of the equipment.

Remaining life of existing equipment is assumed to be 6 years.²⁹²

DEEMED MEASURE COST

Time of sale: The incremental capital cost for this measure is dependent on the efficiency of the new unit.²⁹³

Efficiency (SEER)	Incremental Cost (\$/unit)
14.5	\$123
15	\$303
16	\$438
17	\$724
18+	\$724

Actual costs may be used if associated baseline costs can also be estimated for the application.

Early replacement: The full install cost for this measure is the actual cost of removing the existing unit and installing the new one. If this is unknown, assume the following (note these costs are per ton of unit capacity):²⁹⁴

Efficiency (SEER)	Full Retrofit Cost (including labor) per Ton of Capacity (\$/ton)
14.5	\$2,355 / ton +\$123
15	\$2,355 / ton +\$303
16	\$2,355 / ton +\$438
17	\$2,355 / ton +\$724
18+	\$2,355 / ton +\$724

Assumed deferred cost (after 6 years) of replacing existing equipment with new baseline unit is assumed to be \$2,355 per ton of capacity.²⁹⁵ This cost should be discounted to present value using the utilities' discount rate.²⁹⁶

Quality Installation: The additional design and installation work associated with quality installation has been estimated to add \$150 to the installed cost.²⁹⁷

Average/ unknown	2160	2272	1561	1846	2019	2401	

Capacity _{Heat}	= Heating capacity of Air Source Heat Pum Temperature Steady State Heating, 47°F D	p (Btu/hr) at Standard Rating Conditions (High ry-bulb)
	= Actual (where 1 ton = 12,000Btu/hr)	
$HSPF_{Base}$	= Heating System Performance Factor (kBtu/kWh)	(HSPF) of baseline Air Source Heat Pump
	= 8.2 ³⁰⁶	
HSFP_ee	= Heating System Performance Factor (HSF	PF) of efficient Air Source Heat Pump
	(kBtu/kWh)	
	= Actual. If unknown assume 8.6 ³⁰⁷	
HSPF _{Exist}	= Heating System Performance Factor (HSF	PF) of existing heating system (kBtu/kWh)
	= Use actual HSPF rating where it is possi available, use:	ble to measure or reasonably estimate. If not
	Existing Heating System	HSPF_exist
	Air Source Heat Pump	5.44 ³⁰⁸
	Electric Resistance or Electric Furnace	3.41 ³⁰⁹

DeratingHeat_{eff} = Efficent ASHP Heating derating

- = 0% if Quality Installation is performed
- = 11.8% if Quality Installation is not performed³¹⁰

DeratingHeat_{base} = Baseline ASHP Heating derating

= 11.8%

³⁰⁶ Based on review of available non-ES models on AHRI directory on 04/19/2017. See 'CAC and ASHP AHRI average_04262017.xls'.

³⁰⁷ Based on review of available ENERGY STAR models on AHRI directory on 04/19/2017. See 'CAC and ASHP AHRI average_04262017.xls'.

³⁰⁸ This is estimated based on finding the average HSPF/SEER ratio from the AHRI directory data (using the least efficient models – SEER 12 and SEER 13) – 0.596, and applying to the average nameplate SEER rating of all Early Replacement qualifying equipment in Ameren, IL PY3-PY4 (2010-2012). This estimation methodology appears to provide a result within 10% of actual HSPF.

 $^{^{309}}$ Electric resistance has a COP of 1.0, which equals 1/0.293 = 3.41 HSPF.

³¹⁰ Based on Cadmus assumption in IPL TRM– results in a QI savings that is within a feasible range.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.1 Central Air Source Heat Pump

Time of Sale:

For example, for a three ton, 15 SEER, 12 EER, 9 HSPF Air Source Heat Pump installed <u>with</u> quality installation in an existing single family home in unknown location:

 $\Delta kWh = ((811 * 36,000 * (1/(14.4 * (1-10.5\%)) - 1/(15 * (1-0\%)))) / 1000) + ((2272 * 36,000 * (1/(8.2 * (1-11.8\%))) - 1/(9 * (1-0\%)))) / 1000)$

= 2540.0 kWh

For example, for a three ton, 15 SEER, 12 EER, 9 HSPF Air Source Heat Pump installed <u>without</u> quality installation in an existing single family home in unknown location:

 $\Delta kWh = ((811 * 36,000 * (1/(14.4 * (1-10.5\%)) - 1/(15 * (1-10.5\%)))) / 1000) + ((2272 * 36,000 * (1/(8.2 * (1-11.8\%))) - 1/(9 * (1-11.8\%)))) / 1000)$

= 1095.9 kWh

Early Replacement:

For example, for a three ton, 15 SEER, 12 EER, 9 HSPF Air Source Heat Pump that replaces an existing working Air Source Heat Pump using quality installation with unknown efficiency ratings in unknown location:

ΔkWH for remaining life of existing unit (1st 6 years):

$$= ((811 * 36,000 * (1/(9.12 * (1-10.5\%)) - 1/(15 * (1-0\%)))) / 1000) + ((2272 * 36,000 * (1/(5.44 * (1-11.8\%)) - 1/(9 * (1-0\%)))) / 1000)$$

= 9589.3 kWh
 Δ kWH for remaining measure life (next 12 years):
= ((811 * 36,000 * (1/(14.4 * (1-10.5\%)) - 1/(15 * (1-0\%)))) / 1000) + ((2272 * 36,000 * (1/(8.2 * (1-11.8\%)) - 1/(9 * (1-0\%)))) / 1000)
= 2540.0 kWh

SUMMER COINCIDENT PEAK DEMAND SAVINGS

Time of sale:

$$\Delta kW = \left[\frac{Capacity_{Cool} * \left(\frac{1}{(EER_{base} * (1 - DeratingCool_{base}))} - \frac{1}{(EER_{ee} * (1 - DeratingCool_{eff}))}\right)}{1000}\right]$$

$$* CF$$

Early replacement:³¹¹

 ΔkW for remaining life of existing unit (1st 6 years):

$$\Delta kW = \left[\frac{Capacity_{Cool} * \left(\frac{1}{(EER_{exist} * (1 - DeratingCool_{base}))} - \frac{1}{(EER_{ee} * (1 - DeratingCool_{eff}))}\right)}{1000}\right] \\ * CF$$

 ΔkW for remaining measure life (next 12 years):

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.2 Central Air Conditioner

2.4.2 Central Air Conditioner

DESCRIPTION

This measure characterizes:

- a) Time of Sale:
 - i. The installation of a new high efficiency residential Central Air Conditioner ducted split system. This could relate to the replacement of an existing unit at the end of its useful life, or the installation of a new system in a new home. The characterization can be used for both residential sized units (< 65,000 Btu/hr) and larger units (≥65,000 and <135,000 Btu/hr).
- b) Early Replacement:
 - i. The early removal of an existing inefficient Central Air Conditioner unit from service, prior to its natural end of life, and replacement with a new qualifying unit. Savings are calculated between existing unit and efficient unit consumption during the remaining life of the existing unit, and between new baseline unit and efficient unit consumption for the remainder of the measure life.
 - ii. In order to apply Early Replacement savings, the existing unit must be functioning and SEER ≤10. "Functioning" is defined as being fully operational – providing sufficient space conditioning (i.e., heat exchanger, compressors, pumps work effectively) and/or the cost of repair is under 20% of the new baseline replacement cost. Therefore, in order to apply early replacement assumptions, the programs should apply the following eligibility criteria: SEER ≤10 and cost of any repairs <\$437 per ton.</p>

Quality Installation:

Additional savings are attributed to the Quality Installation (QI) of the system. QI programs should follow industry standards such as those described in ANSI ACCA QI5 and QI9vp. This must include considerations of system design (including sizing, matching, ventilation calculations) and equipment installation (including static pressure, airflow, refrigerant charge) and may also consider distribution.

This measure was developed to be applicable to the following program types: TOS, NC, EREP. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the efficient equipment is assumed to be a ducted split Central Air Conditioner unit meeting or exceeding the minimum efficiency standards set by the utility and at least \geq 14 SEER and 11.5 EER (note the v5 ENERGY STAR efficiency level standards: 15 SEER and 12.5 EER³²⁰).

DEFINITION OF BASELINE EQUIPMENT

The current Federal Standard efficiency level is 13 SEER and 11.2 EER for units <65,000 Btu/hr³²¹ or 11.4 IEER and 11.2 EER for units \geq 65,000 Btu/hr.³²² For calculating savings for units <65,000 Btu/hr, the average of non-ENERGY STAR available product is used: 13.6 SEER and 11.5 EER. It is assumed that 'Quality Installation' did not occur.

The baseline for the early replacement measure is the efficiency of the existing equipment for the assumed

- ³²¹ The federal Standard does not currently include an EER component. The value is approximated based on the SEER standard (13) and equals EER 11.2. To perform this calculation we are using this formula: (-0.02 * SEER²) + (1.12 * SEER) (from Wassmer, M. (2003). A Component-Based Model for Residential Air Conditioner and Heat Pump Energy Calculations. Masters Thesis,
- University of Colorado at Boulder).

³²⁰ Version 5.0 ENERGY STAR specifications, effective September 15, 2015.

³²² Based on IECC 2012 requirements.

Iowa Energy Efficiency Statewide Technical Reference Manual-2.4.2 Central Air Conditioner

remaining useful life of the unit and the new baseline as defined above for the remainder of the measure life.³²³

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected equipment measure life is assumed to be 18 years.³²⁴ Quality installation savings are assumed to last the lifetime of the equipment because they come from the selection of fans and ducts, as well as airflow and other settings that do not change through normal operation of the equipment.

Remaining life of existing equipment is assumed to be 6 years.³²⁵

DEEMED MEASURE COST 326

Time of sale: The incremental capital cost for this measure is dependent on efficiency. Assumed costs are provided below:³²⁷

Efficiency Level (SEER)	Incremental Cost
14	\$0
15	\$108
16	\$221
17	\$620
18+	\$620

Actual costs may be used if associated baseline costs can also be estimated for the application.

Early replacement: The full install cost for this measure is the actual cost of removing the existing unit and installing the new one. If this is unknown, assume the following (note these costs are per ton of unit capacity):³²⁸

Efficiency Level (SEER)	Full Retrofit Cost per Ton of Capacity (\$/ton)
14	\$2,185/ ton + \$0
15	\$2,185/ ton + \$108
16	\$2,185/ ton + \$221
17	\$2,185/ ton + \$620
18+	\$2,185/ ton + \$620

Assumed deferred cost (after 6 years) of replacing existing equipment with new baseline unit is assumed to be \$2,185.³²⁹ This cost should be discounted to present value using the utilities' discount rate.³³⁰

Quality Installation: The additional design and installation work associated with quality installation has been estimated to add \$150 to the installed cost.³³¹

The "lifespan" of a central air conditioner is about 15 to 20 years. See reference file "GDS_MeasureLifeStudy_1Jun2007.". ³²⁵ Assumed to be one third of effective useful life.

³²³ Baseline SEER and EER should be updated when new minimum federal standards become effective.

³²⁴ Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, June 2007.

³²⁶ Measure costs will be updated when results of MidAmerican's HVAC incremental cost study are available.

³²⁷ Based on incremental cost results from Cadmus "HVAC Program: Incremental Cost Analysis Update", December 19, 2016.

³²⁸ Costs based upon average cost per ton from "2010-2012 WA017 Ex Ante Measure Cost Study Draft Report", Itron, February 28, 2014.

³²⁹ Costs based upon average cost per ton from "2010-2012 WA017 Ex Ante Measure Cost Study Draft Report", Itron, February 28, 2014.

³³⁰ Costs provided have not been adjusted for inflation and therefore should be discounted using a Real Discount Rate (RDR) rather than a nominal one.

³³¹ Based on data provided by MidAmerican in April 2018 summarizing survey results from 11 HVAC suppliers.

SEERee	= Seasonal Energy Efficiency Ratio (SEER) of efficient unit (kBtu/kWh)		

³³³ Full load hours for Des Moines are provided based on Cadmus modeling for the 2011 Joint Assessment. The other locations were calculated based on relative Cooling Degree Day ratios (from NCDC).

³³⁴ Based on review of available non-ES models on AHRI directory on 04/19/2017. See 'CAC and ASHP AHRI average_04262017.xls'.

³³⁵ Average nameplate efficiencies of all Early Replacement qualifying equipment in Ameren IL PY3-PY4 (2010-2012). The utilities should collect this information if possible to inform a future update.

Iowa Energy Efficiency Statewide Technical Reference Manual-2.4.2 Central Air Conditioner

	= Actual installed or 15 if ENERGY STAR ³³⁶
DeratingCool _{eff}	= Efficent Central Air Conditioner Cooling derating
	= 0% if Quality Installation is performed
	= 10.5% if Quality Installation is not performed ³³⁷
DeratingCoolbase	= Baseline Central Air Conditioner Cooling derating
	= 10.5%
IEERbase	= Integrated Energy Efficiency Ratio (IEER) of baseline unit (kBtu/kWh)
	= 11.4 ³³⁸
IEERexist	= Integrated Energy Efficiency Ratio (IEER) of existing unit (kBtu/kWh)
	= Use actual IEER rating where it is possible to measure, or reasonably estimate
IEERee	= Integrated Energy Efficiency Ratio (IEER) of efficient unit (kBtu/kWh)
	= Actual installed

Time of Sale:	
For example, for a 3 ton unit with	h SEER rating of 15, in unknown location with quality installation:
∆kWH = (811 * 36,00	0 * (1/(13.6 * (1-10.5%)) – 1/(15 * (1-0%)))) / 1000
= 452.2 kWh	
For example, for a 3 ton unit wi	h SEER rating of 15, in unknown location without quality installation:
∆kWH = (811 * 36,00	0 * (1/(13.6 * (1-10.5%)) – 1/(15 * (1-10.5%)))) / 1000
= 223.9 kWh	
Early Replacement:	
For example, for a 3 ton unit, unknown efficiency in a single fa	with SEER rating of 15 replacing an existing unit with quality installation with mily home in Burlington, IA:
∆kWH(for first 6 years)	= (918 * 36,000 * (1/(10* (1-10.5%)) - 1/(15 * (1-0%)) / 1000
	= 1,489.3 kWh
∆kWH(for next 12 years	s) = (918 * 36,000 * (1/(13.6 * (1-10.5%)) - 1/(15 * (1-0%)))) / 1000
	= 511.9 kWh

Therefore, record a savings adjustment of 34% (511.9/1489.3) after 6 years.

SUMMER COINCIDENT PEAK DEMAND SAVINGS

Time of sale:

³³⁶ Based on review of available ENERGY STAR models on AHRI directory on 04/19/2017. See 'CAC and ASHP AHRI average_04262017.xls'.

³³⁷ Based on Cadmus assumption in IPL TRM– results in a QI savings that is within a feasible range.

³³⁸ Based on IECC 2012 requirements.

³⁴⁵ This higher CF accounts for the demand benefit from right sizing the equipment,

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.3 Boiler

2.4.3 Boiler

DESCRIPTION

High efficiency boilers achieve most gas savings through the use of a sealed combustion chamber and multiple heat exchangers that remove a significant portion of the waste heat from flue gases. Because multiple heat exchangers are used to remove waste heat from the escaping flue gases, some of the flue gases condense and must be drained.

This measure characterizes:

- a) Time of Sale:
 - i. The installation of a residential sized (<300,000 Btuh/h) new high efficiency, gas-fired hot water boiler in a residential location. This could relate to the replacement of an existing unit at the end of its useful life, or the installation of a new system in a new home.
- b) Early Replacement:
 - i. The early removal of an existing functional boiler from service, prior to its natural end of life, and replacement with a residential sized (<300,000 Btuh/h) new high efficiency unit. Savings are calculated between existing unit and efficient unit consumption during the remaining life of the existing unit, and between new baseline unit and efficient unit consumption for the remainder of the measure life.
 - ii. In order to apply Early Replacement savings, the existing unit must be functioning and AFUE ≤75%. "Functioning" is defined as being fully operational – providing sufficient space conditioning (i.e., heat exchanger, compressors, pumps work effectively) and/or the cost of repair is under 20% of the new baseline replacement cost. Therefore, in order to apply early replacement assumptions the programs should apply the following eligibility criteria: AFUE ≤75% and cost of any repairs <\$811.</p>

This measure was developed to be applicable to the following program types: TOS, NC, EREP. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure the installed Boiler must be a residential sized (<300,000 Btuh/h) unit that meets or exceeds the efficiency requirements determined by the program.

DEFINITION OF BASELINE EQUIPMENT

Time of sale: The baseline equipment for this measure is a new residential sized (<300,000 Btuh/h), gas-fired, standard-efficiency water boiler. The current Federal Standard minimum AFUE rating is 84%.³⁴⁶

Early replacement: The baseline for this measure is the efficiency of the existing equipment for the assumed remaining useful life of the unit and the new baseline as defined above for the remainder of the measure life.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 25 years.³⁴⁷

Early replacement: Remaining life of existing equipment is assumed to be 8 years.³⁴⁸

³⁴⁶ Code of Federal Regulations for gas-fired hot water boilers manufactured on or after January 15, 2021 (10 CFR 432(e)(3))

³⁴⁷ Federal Appliance Standards, Chapter 8.3 of DOE Technical Support Documents, Table 8.3.3.

³⁴⁸ Assumed to be one third of effective useful life.

DEEMED O&M COST ADJUSTMENT CALCULATION

N/A

MEASURE CODE: RS-HVC-GHEB-V04-210101

SUNSET DATE: 1/1/2025

2.4.4 Furnace

DESCRIPTION

This measure covers the installation of a residential sized (<225,000 Btuh/h) high efficiency gas furnace in a residential application. High efficiency gas furnaces achieve savings through the use of a sealed, super insulated combustion chamber, more efficient burners, and multiple heat exchangers that remove a significant portion of the waste heat from the flue gases. Because multiple heat exchangers are used to remove waste heat from the escaping flue gases, most of the flue gases condense and must be drained. Furnaces equipped with ECM fan motors can save additional electric energy. The ECM furnace fan is a separate measure.

This measure characterizes:

- a) Time of Sale:
 - i. The installation of a new residential sized (<225,000 Btuh/h) high efficiency, gas-fired furnace in a residential location. This could relate to the replacement of an existing unit at the end of its useful life, or the installation of a new system in a new home.
- b) Early Replacement:
 - i. The early removal of an existing functional furnace from service, prior to its natural end of life, and replacement with a new residential sized (<225,000 Btuh/h) high efficiency unit. Savings are calculated between existing unit and efficient unit consumption during the remaining life of the existing unit, and between new baseline unit and efficient unit consumption for the remainder of the measure life.
 - In order to apply Early Replacement savings, the existing unit must be functioning and AFUE ≤75%. "Functioning" is defined as being fully operational – providing sufficient space conditioning (i.e., heat exchanger, compressors, pumps work effectively) and/or the cost of repair is under 20% of the new baseline replacement cost. Therefore, in order to apply early replacement assumptions the programs should apply the following eligibility criteria: AFUE ≤75% and cost of any repairs <\$516.

Quality Installation:

Additional savings are attributed to the Quality Installation (QI) of the system. QI programs should follow industry standards such as those described in ANSI ACCA QI5 and QI9vp. This must include considerations of system design (including sizing, matching, ventilation calculations) and equipment installation (including static pressure, airflow, combustion efficiency) and may also consider distribution.

This measure was developed to be applicable to the following program types: TOS, NC, EREP. If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

To qualify for this measure, the installed equipment must be a furnace with input energy < 225,000 Btu/hr rated natural gas fired furnace with an Annual Fuel Utilization Efficiency (AFUE) rating that meets program standards.

DEFINITION OF BASELINE EQUIPMENT

Time of Sale or New Construction: The baseline for this measure is an AFUE rating of 85%.³⁵⁷ It is assumed that 'Quality Installation' did not occur.

³⁵⁷ The Federal Standard of 80% is inflated to 85% for Furnaces to account for significant market demand above the Federal minimum. This is based upon agreement of the Technical Advisory Committee, reviewing information from other jurisdictions and in lieu of Iowa-specific information. Note that when an IA net-to-gross (NTG) factor is determined for this measure, this adjusted baseline should be replaced with the appropriate Federal Standard efficiency level.

Early Replacement: The baseline for this measure is the efficiency of the existing equipment for the assumed remaining useful life of the unit and a new baseline unit for the remainder of the measure life.

DEFINITION OF MEASURE LIFE

The expected equipment measure life is assumed to be 20 years.³⁵⁸ Quality installation savings are assumed to last the time of the equipment because they come from the selection of fans and ducts, as well as airflow and other settings that do not change through normal operation of the equipment.

For early replacement: Remaining life of existing equipment is assumed to be 6 years.³⁵⁹

DEEMED MEASURE COST

The incremental capital cost for this measure depends on efficiency as listed below:³⁶⁰

AFUE	Full Install Cost	Incremental Install Cost
85%	\$4,030	N/A
86%	\$4,086	\$56
87%	\$4,143	\$113
88%	\$4,199	\$169
89%	\$4,256	\$226
90%	\$4,312	\$282
91%	\$4,369	\$339
92%	\$4,425	\$395
93%	\$4,482	\$452
94%	\$4,538	\$508
95%	\$4,595	\$565
96%	\$4,888	\$858
97%	\$5,181	\$1,151
98%	\$5,474	\$1,444
99%	\$5,768	\$1,738

Actual costs may be used if associated baseline costs can also be estimated for the application.

Early Replacement: The full installation cost is provided in the table above. The assumed deferred cost (after 6 years) of replacing existing equipment with a new baseline unit is assumed to be \$4,312.³⁶¹ This cost should be discounted to present value using the utilities' discount rate.³⁶²

Quality Installation: The additional design and installation work associated with quality installation has been estimated to add \$90 to the installed cost.³⁶³

³⁵⁸ Federal Appliance Standards, Chapter 8.3 of DOE Technical Support Documents, Table 8.3.3.

³⁵⁹ Assumed to be one third of effective useful life

³⁶⁰ Based on data provided by MidAmerican in April 2018 summarizing survey results from 11 HVAC suppliers. Full install costs are interpolated from data provided in the 2018 MA 'Water Heating, boiler and Furnace Cost Study' and adjusted from MA to IA costs using the 2016 implicit regional price deflators from the Bureau of Economic Analysis. See "Iowa Incremental Cost Study2_Adjusted.xls" for more information.

³⁶¹ This assumes that by the time the existing unit would need to be replaced (in 6 years), the new Federal Standard will be in place that makes the baseline 90% (as was rescinded in 2012).

³⁶² Costs provided have not been adjusted for inflation and therefore should be discounted using a Real Discount Rate (RDR) rather than a nominal one.

³⁶³ Based on data provided by MidAmerican in April 2018 summarizing survey results from 11 HVAC suppliers.

Iowa Energy Efficiency Statewide Technical Reference Manual-2.4.4 Furnace

MEASURE CODE: RS-HVC-FRNC-V04-200101

SUNSET DATE: 1/1/2022

2.4.5 Furnace Blower Motor

NOTE: THIS MEASURE IS EFFECTIVE UNTIL 12/31/2019. IT SHOULD NOT BE USED BEYOND THAT DATE BUT IS LEFT IN THE MANUAL FOR REFERENCE PURPOSES.

DESCRIPTION

A new furnace with a brushless permanent magnet furnace blower motor (BPM) (also known as an Electronically Commutated Motor (ECM)) is installed instead of a new furnace with a lower efficiency motor. This measure characterizes only the electric savings associated with the fan and could be coupled with gas savings associated with a more efficient furnace. Savings decrease sharply with static pressure, so duct improvements and design, and clean, low pressure drop filters can maximize savings. Savings improve when the blower is used for cooling as well as when it is used for continuous ventilation, but only if the non-BPM motor would have been used for continuous ventilation as well. If the resident runs the BPM blower continuously because it is a more efficient motor and would not run a non-BPM motor in the same way, savings are near zero and possibly negative. This characterization uses a 2009 Focus on Energy study of BPM blower motor savings in Wisconsin, which accounted for the effects of this behavioral impact.

This measure also includes a section accounting for the interactive effect of reduced waste heat on the heating loads.

This measure was developed to be applicable to the following program types: TOS, NC.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

A furnace with a brushless permanent magnet (BPM) blower motor, also known by the trademark ECM, BLDC, and other names.

DEFINITION OF BASELINE EQUIPMENT

A furnace with a non-BPM blower motor.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 20 years³⁷⁰.

DEEMED MEASURE COST

The capital cost for this measure is assumed to be \$97³⁷¹ if a stand-alone measure or \$0 if coupled with 2.4.4 Furnace measure, since incremental cost of a fan will be included in that measure cost.

LOADSHAPE

Loadshape RE07 – Residential Single Family Cooling

Loadshape RE06 – Residential Single Family Central Heat

³⁷⁰ Consistent with assumed life of a new gas furnace. Federal Appliance Standards, Chapter 8.3 of DOE Technical Support Documents, Table 8.3.3.

³⁷¹ Adapted from Tables 8.2.3 and 8.2.13 in Technical Support Documents for Federal residential appliance standards: "Chapter 8, Life-Cycle Cost and Payback Period Analysis", 2011. This is for new furnaces, not retrofitting an existing furnace.

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

 $\Delta kWh = Heating Savings + Cooling Savings + Shoulder Season Savings$

Where:

Heating Savings = Blower motor savings during heating season³⁷²

			Н	eating Savings (kV	Vh)
Building Type	Vintage	End Use	Zone 5 (Burlington)	Zone 6 (Mason City)	Average / Unknown
Manufactured	Existing	Heat Central Furnace	268.4	381.5	301.6
Manufactured	New	Heat Central Furnace	193.5	275.0	217.4
Multifamily	Existing	Heat Central Furnace	222.6	316.4	250.1
Multifamily	New	Heat Central Furnace	158.8	225.7	178.5
Single-family	Existing	Heat Central Furnace	262.0	372.4	294.4
Single-family	New	Heat Central Furnace	227.7	323.7	255.9
Residential ³⁷³	Residential	Heat Central Furnace		290.0	

Cooling Savings

= Blower motor savings during cooling season

If home has Central AC:

			Cooling	g Savings with C	AC (kWh)
Building Type	Vintage	End Use	Zone 5 (Burlington)	Zone 6 (Mason City)	Average / Unknown
Manufactured	Existing	Cool Central	266.2	208.0	252.3
Manufactured	New	Cool Central	217.3	183.1	209.2
Multifamily	Existing	Cool Central	248.5	199.0	236.7
Multifamily	New	Cool Central	216.7	182.8	208.6
Single-family	Existing	Cool Central	273.5	211.7	258.8
Single-family	New	Cool Central	222.7	185.9	214.0
Residential	Residential	Cool Central		256.5	

If No Central AC = 147.6 kWh³⁷⁴

If unknown³⁷⁵:

³⁷² To estimate heating, cooling, and shoulder season savings for Iowa, VEIC adapted results from a 2009 Focus on Energy study of BPM blower motor savings in Wisconsin. This study included effects of behavior change based on the efficiency of new motor greatly increasing the amount of people that run the fan continuously. The savings from the Wisconsin study were adjusted to account for different equivalent full load hour assumptions for Iowa. See: FOE to IA Blower Savings.xlsx. ³⁷³ Where location and home turn is unknown.

³⁷³ Where location and home type is unknown.

³⁷⁴ These savings are for those homes that use the fan on continuous mode (13% of households) from Focus on Energy study.

³⁷⁵ The weighted average value is based on assumption that 86% of homes installing BPM furnace blower motors have Central AC. Using the formula from Note 1 in Table B-2 in the FOE study, and assuming that before the furnace purchase, purchasing households have the statewide average CAC penetration, and that the percent of purchasers that add CAC during the purchase is the same in IA as WI.

			Cooling Savir	ngs, if cooling ι	unknown (kWh)
Building Type	Vintage	End Use	Zone 5 (Burlington)	Zone 6 (Mason City)	Average / Unknown

³⁸¹ Calculated using Cadmus provided Gas Loadshapes as the maximum daily load for the end use.

2.4.6 Geothermal Source Heat Pump

DESCRIPTION

This measure characterizes the installation of an ENERGY STAR qualified Geothermal Source Heat Pump (GSHP) either during new construction or at Time of Sale/Replacement of an existing system(s). Savings are realized due to the GSHP providing heating and cooling more efficiently than the existing or baseline unit, and where a desuperheater is installed, additional Domestic Hot Water (DHW) savings are realized due to displacing existing water heating.

This measure characterizes:

- c) Time of Sale:
 - ii. The installation of a new residential sized ground source heat pump in place of a new baseline Air Source Heat Pump (ASHP) meeting federal standards. This could relate to the replacement of an existing unit at the end of its useful life, or the installation of a new system in a new home.
- d) Early Replacement:
 - iii. The early removal of functioning electric heating and cooling (if present) systems from service, prior to the natural end of life, and replacement with a new high efficiency ground source heat pump unit. Savings are calculated between existing unit and efficient unit consumption during the remaining life of the existing unit, and between new baseline Air Source Heat Pump and efficient unit consumption for the remainder of the measure life.
 - iv. In order to apply Early Replacement savings, the existing unit must be fully operational providing sufficient space conditioning and/or the cost of repair is under 20% of the new baseline replacement cost (<\$471 per ton).</p>

Quality Installation:

Additional savings are attributed to the Quality Installation (QI) of the system. QI programs should follow industry standards such as those described in ANSI ACCA QI5 and QI9vp. This must include considerations of system design (including sizing, matching, ventilation calculations) and equipment installation (including static pressure, airflow, refrigerant charge) and may also consider distribution.

This measure was developed to be applicable to the following program types: TOS, NC, EREP.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the efficient equipment must be a Geothermal Source Heat Pump unit meeting the minimum ENERGY STAR efficiency level standards effective at the time of installation as detailed below:

Product Type	Cooling EER	Heating COP		
Water-to-air				
Closed Loop	17.1	3.6		
Open Loop 21.1		4.1		
Water-to-Water				
Closed Loop	16.1	3.1		
Open Loop	20.1	3.5		
DGX	16	3.6		

ENERGY STAR Requirements (Effective January 1, 2012)

DEFINITION OF BASELINE EQUIPMENT

New Construction:

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.6 Geothermal Source Heat Pump

The baseline equipment is assumed to be an Air Source Heat Pump meeting the Federal Standard efficiency level: 14 SEER, 8.2 HSPF, and 11.8 EER.³⁸² If a desuperheater is installed, the baseline for DHW savings is assumed to be a Federal Standard electric hot water heater, with Energy Factor calculated as follows:³⁸³

For ≤55 gallons:	EF	= 0.96 – (0.0003 * rated volume in gallons)
For >55 gallons:	EF	= 2.057 – (0.00113 * rated volume in gallons)

If size is unknown, assume 50 gallon; 0.945 EF.

Time of Sale:

The baseline equipment is assumed to be an Air Source Heat Pump meeting the Federal Standard efficiency level: 14 SEER, 8.2 HSPF, and 11.8 EER. If a desuperheater is installed, the baseline for DHW savings is assumed to be the existing home's hot water heater fuel and efficiency.

If electric DHW, and unknown efficiency – assume efficiency is equal to pre 4/2015 Federal Standard:

 $EF = 0.93 - (0.00132 * rated volume in gallons)^{384}$

If size is unknown, assume 50 gallon; 0.864 EF

If gas water heater, and unknown efficiency – assume efficiency is equal to pre 04/2015 Federal Standard:

EF = $(0.67 - 0.0019 * rated volume in gallons)^{385}$

If size is unknown, assume 40 gallon; 0.594 EF

If DHW fuel is unknown, assume electric DHW provided above.

Early replacement / Retrofit:

The baseline is the efficiency of the *existing* electric heating, cooling and hot water equipment for the assumed remaining useful life of the existing unit and a new baseline Air Source Heat Pump for the remainder of the measure life.

It is assumed that 'Quality Installation' did not occur.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected equipment measure life for Time of Sale or New Construction is assumed to be 25 years.³⁸⁶

For early replacement, the remaining life of existing equipment is assumed to be 8 years.³⁸⁷

Quality installation savings are assumed to last the time of the equipment because they come from the selection of fans and ducts, as well as airflow and other settings that do not change through normal operation of the equipment.

DEEMED MEASURE COST

New Construction and Time of Sale: The actual installed cost of the Geothermal Source Heat Pump should be used

³⁸² The Federal Standard does not include an EER requirement, so it is approximated with this formula: (-0.02 * SEER²) + (1.12 * SEER) Wassmer, M. (2003). A Component-Based Model for Residential Air Conditioner and Heat Pump Energy Calculations. Master's Thesis, University of Colorado at Boulder.

³⁸³ Minimum Federal Standard as of 4/1/2015; http://www.gpo.gov/fdsys/pkg/CFR-2012-title10-vol3/pdf/CFR-2012-title10-vol3-sec430-32.pdf

³⁸⁴ Federal Standard from 2004 until 2015, Federal Register Vol. 66, No. 11/1/17/2001, page 4497.

³⁸⁵ Federal Standard from 2004 until 2015, Federal Register Vol. 66, No. 11/1/17/2001, page 4497.

³⁸⁶ System life of indoor components as per DOE estimate: http://energy.gov/energysaver/articles/geothermal-heat-pumps. The ground loop has a much longer life, but the compressor and other mechanical components are the same as an ASHP (based on Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, June 2007). ³⁸⁷ Assumed to be one third of effective useful life

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.6 Geothermal Source Heat Pump

(default of \$3,381 per ton³⁸⁸), minus the assumed installation cost of the baseline equipment (\$1,867 per ton of capacity for ASHP³⁸⁹).

Early Replacement: The full installation cost of the Ground Source Heat Pump should be used (default provided above). The assumed deferred cost (after 8 years) of replacing existing equipment with a new baseline Air Source Heat Pump is assumed to be \$2,152 per ton.³⁹⁰ This future cost should be discounted to present value using the nominal societal discount rate.

Quality Installation: The additional design and installation work associated with quality installation has been estimated to add \$150 to the installed cost.³⁹¹

LOADSHAPE

Loadshape RE08 – Residential Single Family Heat Pump

Loadshape RE12 – Residential Single Family Water Heat (Electric)

Loadshape RG07 – Residential Water Heat (Gas)

³⁸⁸ Based on data provided on Home Advisor website, providing national average GSHP costs based on actual project quotes from 132 Home Advisor members and contractors. Equipment and material cost of \$2,581 per ton plus an added \$800 per ton installation cost, assuming a horizontal loop.

³⁸⁹ Based on data provided on Home Advisor website, providing national average ASHP costs based on actual project quotes from 3,523 Home Advisor members and contractors.

³⁹⁰ The baseline replacement costs is adjusted for 8 years of inflation using inflation rate of 1.91%.

³⁹¹ Based on data provided by MidAmerican in April 2018 summarizing survey results from 11 HVAC suppliers, see 'lowa HVAC Incremental Cost Study' for details.

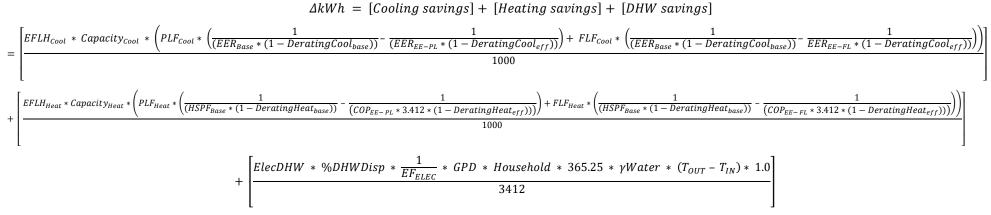

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.6 Geothermal Source Heat Pump

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

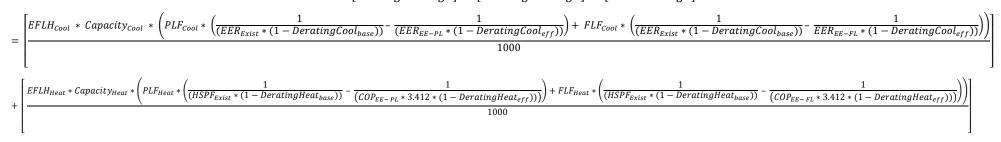

Time of sale, New Construction:

Early replacement:³⁹²

 Δ kWH for remaining life of existing unit (1st 8 years):

 $\Delta kWh = [Cooling savings] + [Heating savings] + [DHW savings]$

³⁹² The two equations are provided to show how savings are determined during the initial phase of the measure (existing to efficient) and the remaining phase (new baseline to efficient). In practice, the screening tools used may either require a First Year savings (using the first equation), and then a "number of years to adjustment" and "savings adjustment" input that would be the (new base to efficient savings)/(existing to efficient savings).

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.4.6 Geothermal Source Heat Pump

$$+ \left[\frac{ElecDHW * \%DHWDisp * \frac{1}{EF_{ELEC}} * GPD * Household * 365.25 * \gamma Water * (T_{OUT} - T_{IN}) * 1.0}{3412}\right]$$

ΔkWH for remaining measure life (next 17 years):

$$\Delta kWh = [Cooling savings] + [Heating savings] + [DHW savings]$$

$$= \left[\frac{EFLH_{cool} * Capacity_{cool} * \left(PLF_{cool} * \left(\frac{1}{(EER_{Base} * (1 - DeratingCool_{base}))} - \frac{1}{(EER_{EE-PL} * (1 - DeratingCool_{eff}))}\right) + FLF_{cool} * \left(\frac{1}{(EER_{Base} * (1 - DeratingCool_{base}))} - \frac{1}{EER_{EE-FL} * (1 - DeratingCool_{eff}))}\right)}{1000}\right]$$

$$+ \left[\frac{EFLH_{Heat} * Capacity_{Heat} * \left(PLF_{Heat} * \left(\frac{1}{(HSPF_{Base} * (1 - DeratingHeat_{base}))} - \frac{1}{(COP_{EE-PL} * 3.412 * (1 - DeratingHeat_{eff})))}\right)} + FLF_{Heat} * \left(\frac{1}{(HSPF_{Base} * (1 - DeratingHeat_{base}))} - \frac{1}{(COP_{EE-FL} * 3.412 * (1 - DeratingHeat_{eff})))}\right)}\right)}{1000}\right]$$

$$+ \left[\frac{ElecDHW * \% DHWDisp * \frac{1}{EF_{ELEC}} * GPD * Household * 365.25 * \gamma Water * (T_{OUT} - T_{IN}) * 1.0}{3412}\right]$$

PLF _{Heat}	= Part load heating mode operation
	= 0.5 if variable speed GSHP ⁴⁰¹
	= 0 if single/constant speed GSHP
FLF _{Heat}	= Full load heating mode operation factor
	= 0.5 if variable speed GSHP
	= 1 if single/constant speed GSHP
HSPF _{Base}	=Heating System Performance Factor (HSPF) of new replacement baseline heating system (kBtu/kWh)
	= 8.2 ⁴⁰²

³⁹⁸ The methodology provided is based upon REMRate protocol 'Auxiliary Electric Energy of Ground Source Heat Pumps'; http://www.resnet.us/standards/Auxiliary_Electric_Energy_of_Ground_Source_Heat_Pumps_Amendment.pdf

³⁹⁹ Based on Cadmus assumption in IPL TRM– results in a QI savings that is within a feasible range.

⁴⁰⁰ Full load hours for Des Moines are provided based on Cadmus modeling for the 2011 Joint Assessment. The other locations were calculated based on relative Heating Degree Day ratios (from NCDC).

⁴⁰¹ Based on Cadmus analysis of the relationship between part- and full-load capacities from building simulations of BEopt (Building Energy Optimization) to generate the energy models. The models were calibrated using Cadmus metered data of 13 high efficiency multi-stage GSHP models functioning in both part- and full-loads.

⁴⁰² Minimum Federal Standard as of 1/1/2015;

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.6 Geothermal Source Heat Pump

HSPF_{Exist} = Heating System Performance Factor (HSPF) of existing heating system (kBtu/kWh)

= Use actual HSPF rating where it is possible to measure or reasonably estimate. If not available, use:

	Existing Heating System HSPF_exist					
	Air Source Heat Pump 5.44 ⁴⁰³					
	Electric Resistance or Electric Furnace3.41					
COP _{EE} - PL	= Part load Coefficient of Performance of efficient unit					
	= Actual Installed with adjustment for pumping energy: ⁴⁰⁵					
	Adjusted COP (closed loop) = 0.000416*COP^3 - 0.041*COP^2 + 1.0086*COP Adjusted COP (open loop) = 0.00067*COP^3 - 0.0531*COP^2 + 0.976*COP					
COP _{EE - FL}	= Full load Coefficient of Performance of efficient unit					
	= Actual Installed with adjustment for pumping energy described above					
DeratingHeat _{eff}	= Efficent GSHP heating derating					
	= 0% if Quality Installation is performed					
	= 11.8% if Quality Installation is not performed ⁴⁰⁶					
DeratingHeat _{base}	e = Baseline GSHP heating derating					
	= 11.8%					
3.412	= Constant to convert the COP of the unit to the Heating Season Performance Factor (HSPF)					
ElecDHW	= 1 if existing DHW is electrically heated					
	= 0 if existing DHW is not electrically heated					
%DHWDisp	= Percentage of total DHW load that the GSHP will provide					
	= Actual if known					
	= If unknown and if desuperheater installed, assume 44% ⁴⁰⁷					
	= 0% if no desuperheater installed					
EF _{ELEC}	= Energy Factor (efficiency) of electric water heater. Note if the unit is rated with a Uniform Energy Factor, for version 2.0 of the TRM this will conservatively be applied as an Energy Factor. In version 3.0, these new ratings will be fully incorporated					

http://www.gpo.gov/fdsys/pkg/CFR-2012-title10-vol3/pdf/CFR-2012-title10-vol3-sec430-32.pdf

⁴⁰⁶ Based on Cadmus assumption in IPL TRM– results in a QI savings that is within a feasible range.

⁴⁰³ This is estimated based on finding the average HSPF/SEER ratio from the AHRI directory data (using the least efficient models – SEER 12 and SEER 13) – 0.596, and applying to the average nameplate SEER rating of all Early Replacement qualifying equipment in Ameren, IL PY3-PY4 (2010-2012). This estimation methodology appears to provide a result within 10% of actual HSPF.

 $^{^{404}}$ Electric resistance has a COP of 1.0, which equals 1/0.293 = 3.41 HSPF.

⁴⁰⁵ The methodology provided is based upon REMRate protocol 'Auxiliary Electric Energy of Ground Source Heat Pumps'; http://www.resnet.us/standards/Auxiliary Electric Energy of Ground Source Heat Pumps Amendment.pdf

 $^{^{407}}$ Assumes that the desuperheater can provide two thirds of hot water needs for eight months of the year (2/3 * 2/3 = 44%). Based on input from Doug Dougherty, Geothermal Exchange Organization.

SUMMER COINCIDENT PEAK DEMAND SAVINGS

Time of Sale, New Construction:

$$\Delta kW = \left[\frac{Capacity_{Cool} * \left(\frac{1}{(EER_{base} * (1 - DeratingCool_{base}))} - \frac{1}{(EER_{EE-FL} * (1 - DeratingCool_{eff}))} \right)}{1000} \right] * CF$$

Early replacement:

 Δ kWH for remaining life of existing unit (1st 8 years):

$$\Delta kW = \left[\frac{Capacity_{Cool} * \left(\frac{1}{(EER_{Exist} * (1 - DeratingCool_{base}))} - \frac{1}{(EER_{EE-FL} * (1 - DeratingCool_{eff}))}\right)}{1000}\right] * CF$$

 Δ kWH for remaining measure life (next 17 years):

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.4.6 Geothermal Source Heat Pump

$$\Delta kW = \left[\frac{Capacity_{Cool} * \left(\frac{1}{(EER_{base} * (1 - DeratingCool_{base}))} - \frac{1}{(EER_{EE-FL} * (1 - DeratingCool_{eff}))}\right)}{1000}\right] * CF$$

Where:

EERbase = Energy Efficiency Ratio (EER) of new baseline unit

 $= 11.8^{415}$

EER_{Exist}

CF

= Energy Efficiency Ratio of existing cooling unit

= Use actual EER rating where it is possible to measure or reasonably estimate. If EER unknown but SEER available convert using the equation:

EERexist = (-0.02 * SEERexist²) + (1.12 * SEERexist)

If SEER rating unavailable use:

Existing Cooling System	EER _{Exist} 416	
Air Source Heat Pump	8.55	
Central AC	8.15	
No central cooling ⁴¹⁷	Set '1/EER_exist' = 0	

- EER_{FL} = Full load Energy Efficiency Ratio (EER) of ENERGY STAR GSHP unit
 - = Actual with adjustment for pumping energy described above

DeratingCool_{eff} = Efficent Central Air Conditioner Cooling derating

= 0% if Quality Installation is performed and/or if unit is right-sized

= 10.5% if Quality Installation is not performed⁴¹⁸

- DeratingCool_{base} = Baseline Central Air Conditioner Cooling derating
 - = 10.5%
 - = Summer system peak Coincidence Factor for cooling
 - = 72% for non-QI 419
 - = 80% for QI or right sized units ⁴²⁰

⁴¹⁵ The Federal Standard does not include an EER requirement, so it is approximated with the conversion formula from Wassmer, M. (2003). A Component-Based Model for Residential Air Conditioner and Heat Pump Energy Calculations. Master's Thesis, University of Colorado at Boulder.

⁴¹⁶ Average nameplate efficiencies of all Early Replacement qualifying equipment in Ameren, IL PY3-PY4 (2010-2012).

⁴¹⁷ If there is no central cooling in place but the incentive encourages installation of a new ASHP with cooling, the added cooling load should be subtracted from any heating benefit.

⁴¹⁸ Based on Cadmus assumption in IPL TRM– results in a QI savings that is within a feasible range.

⁴¹⁹ Based on analysis of metering results from 24 heat pumps in Ameren Illinois service territory in PY5; 'Impact and Process Evaluation of Ameren Illinois Company's Residential HVAC Program (PY5)'.

⁴²⁰ This higher CF accounts for the demand benefit from right sizing the equipment,

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.6 Geothermal Source Heat Pump

For example, for a 3 ton closed loop GSHP unit with Full Load EER rating of 18 installed with quality installation in a new construction single family house in Burlington, IA: Adjusted Full Load EER = $0.0000315*18^3 - 0.0111*18^2 + 0.959*18$ = 13.8 ΔkW = ((36,000 * (1/(11.8 * (1-0.105)) - 1/(13.8 * (1-0))))/1000) * 0.80= 0.6401 kWFor example, for a 3 ton closed loop GSHP unit with Full Load EER rating of 18 installed without quality installation in a new construction single family house in Burlington, IA: ΔkW = ((36,000 * (1/(11.8 * (1-0.105)) - 1/(13.8 * (1-0.105))))/1000) * 0.72= 0.3557 kW

NATURAL GAS SAVINGS

DHW savings for homes with existing gas hot water:

 $\Delta Therms = [DHW Savings]$

$$=\frac{(1 - ElecDHW) * \%DHWDisp * \frac{1}{EF_{Gas}} * GPD * Household * 365.25 * \gamma Water * (T_{OUT} - T_{IN}) * 1.0}{100,000}$$

Where:

 $\mathsf{EF}_{\mathsf{GAS}}$

= Energy Factor (efficiency) of gas water heater

New Construction	= Actual – If unknown, assume federal standard: ⁴²¹			
For ≤55 gallons:	0.675 – (0.0015 * tank_size)			
For > 55 gallons:	0.8012 – (0.00078 * tank size)			
If tank size unkno	own assume 40 gallons; 0.615 EF			
Existing Homes	= Actual – If unknown, assume pre 4/2015 Federal Standard: ⁴²²			
(0.67 – 0.0019 * rated volume in gallons)				
If size is unknow	n, assume 40 gallon; 0.594 EF			

All other variables provided above

For example, for a 3 ton unit with desuperheater installed with a 40 gallon gas water heater in a new construction single family house in Burlington, IA:

ΔTherms = ((1-0) * 0.44 * 1/0.615 * 17.6 * 2.126 *365.25 * 8.33 * (126.5-56.5) * 1) / 100000 = 57.0 Therms

PEAK GAS SAVINGS

 $\Delta PeakTherms = \Delta Therms * GCF$

Where:

ΔTherms = Therm impact calculated above

⁴²¹ Minimum Federal Standard as of 4/1/2015;

MEASURE CODE: RS-HVC-GSHP-V04-200101

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.4.7 Ductless Heat Pumps

2.4.7 Ductless Heat Pumps

DESCRIPTION

This measure is designed to calculate electric savings for supplementing or replacing existing electric HVAC systems with ductless heat pumps or adding conditioning to a new space. Existing systems can include: electric resistance heating or ducted Air Source Heat Pumps (ASHP). Note this measure does not describe savings from displacement of gas heating. In such circumstances a custom calculation should be performed.

Savings are achieved either by displacing some of the heating or cooling load currently provided by the existing system or adding space conditioning to a new space, and meeting that load with the more efficient ductless heat pump. The offset of the home's heating load is likely for the milder heating periods. The limitations on heating offset increase as the outdoor temperature drops, because the DHP capacity decreases, and the point-source nature of the heater is less able to satisfy heating loads in remote rooms.

For cooling, the proposed savings calculations are aligned with those of typical replacement systems. In most cases, the DHP is expected to replace (rather than offset) a comparable amount of cooling in homes at a much higher efficiency than the previously used cooling.

In order for this measure to apply, the control strategy for the heat pump is assumed to be chosen to maximize savings per installer recommendation.⁴²³

This measure was developed to be applicable to the following program types: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the new equipment must be a high-efficiency, variable-capacity (typically "inverter-driven" DC motor) ductless heat pump system that exceeds the program requirements.

DEFINITION OF BASELINE EQUIPMENT

In order for this characterization to apply, baseline equipment must be a permanent electric resistance heating source or a ducted ASHP. Existing cooling equipment is assumed to be standard efficiency. Note that in order to claim cooling savings, there must be an existing air conditioning system.

For adding space conditioning to a new space within a home, for example a new addition, the baseline is assumed to be a baseline ductless heat pump.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 18 years.⁴²⁴

DEEMED MEASURE COST

The full installation cost for this measure should be used, if unavailable a default is provided below:⁴²⁵

⁴²³ The whole purpose of installing ductless heat pumps is to conserve energy, so the installer can be assumed to be capable of recommending an appropriate controls strategy. For most applications, the heating setpoint for the ductless heat pump should be at least 2F higher than any remaining existing system and the cooling setpoint for the ductless heat pump should be at least 2F cooler than the existing system (this should apply to all periods of a programmable schedule, if applicable). This helps ensure that the ductless heat pump will be used to meet as much of the load as possible before the existing system operates to meet the remaining load. Ideally, the new ductless heat pump controls should be set to the current comfort settings, while the existing system setpoints should be adjusted down (heating) and up (cooling) to capture savings.

 ⁴²⁴ Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, Inc., June 2007
 ⁴²⁵ Cadmus, Opinion Dynamics; 'PY7 HVAC and Ductless Mini-Split Heat Pump Incremental Cost Analysis' memo for Ameren Illinois, dated September 4, 2015.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.7 Ductless Heat Pumps

Unit Capacity (BTU/h)	Equivalent Capacity (tons)	Total Installation Cost
12,000	1.00	\$3,051
15,000	1.25	\$4,093
18,000	1.50	\$5,182
20,000	1.67	\$5,897
22,000	1.83	\$6,637
24,000	2.00	\$7,310
28,000	2.33	\$8,209
35,000+	2.92	\$10,814

For adding space conditioning to a new space within a home, the incremental cost should be used and is estimated below:⁴²⁶

SEER	Incremental Cost	
<=18	\$346	
19	\$423	
20	\$498	
21	\$577	
22	\$589	
23	\$605	
24	\$621	
25	\$637	
26+	\$651

	Average/ unknown	2,160	2,272	1,561	1,846	2,019	2,401
	Zone 5 (Burlington)	1,345	1,415	972	1,150	1,258	1,496
Add-on / supplemental	Zone 6 (Mason City)	1,912	2,012	1,383	1,635	1,788	2,126
	Average/ unknown	1,512	1,590	1,093	1,292	1,413	1,681

 $\mathsf{HSPF}_{\mathsf{ee}}$

= HSPF rating of new equipment

= Actual installed

 $\mathsf{HSPF}_{\mathsf{base}}$

= HSPF rating of existing or new baseline equipment

= Actual, if unknown assume:

Existing Equipment Type	HSPFbase
Electric resistance heating	3.41 ⁴²⁹
Air Source Heat Pump	5.44 ⁴³⁰
For new space conditioning,	9 1 ⁴³¹
assume baseline ductless heat pump	9.1

Capacity_{cool} = the cooling capacity of the ductless heat pump unit in Btu/hr.⁴³²

= Actual installed

 $EFLH_{cool}$ = Equivalent Full Load Hours for cooling. Depends on location and application (whole house v addon / supplemental). See table below.⁴³³

⁴²⁷ 1 Ton = 12 kBtu/hr

⁴²⁸ Full load hours for Des Moines are provided based on Cadmus modeling for the 2011 Joint Assessment. The other locations were calculated based on relative Heating Degree Day ratios (from NCDC). Add-on / supplemental EFLH are estimated by multiplying by a factor of 70% (consistent with PA TRM 2013).

⁴²⁹ Electric resistance has a COP of 1.0 which equals 1/0.293 = 3.41 HSPF.

 $^{^{430}}$ This is from the ASHP measure which estimated HSPF based on finding the average HSPF/SEER ratio from the AHRI directory data (using the least efficient models – SEER 12 and SEER 13) – 0.596, and applying to the average nameplate SEER rating of all Early Replacement qualifying equipment in Ameren PY3-PY4. This estimation methodology appears to provide a result within 10% of actual HSPF.

 $^{^{431}}$ Based on average of non-ENERGY STAR qualifying units on AHRI directory. See "AHRI download_0426201.xls" for details. 432 1 Ton = 12 kBtu/hr

⁴³³ Residential EFLH for room AC

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.7 Ductless Heat Pumps

					EFLH _{cool} 434		
Application	Climate Zone (City based upon)	Single Family New	Single Family Existing	Multifamily New	Multifamily Existing	Manufactured New	Manufactured Existing

	6 (Mason City)		168				
	Average/unknown				292		

 $\mathsf{SEER}_{\mathsf{ee}}$

= SEER rating of new equipment

= Actual installed⁴³⁵

SEERexist

= SEER rating of existing equipment

= Use actual value. If unknown, see table below.

Existing Cooling System	SEER_exist
Air Source Heat Pump	9.12
Central AC	8.60 ⁴³⁷
Room AC	8.0 ⁴³⁸
No cooling ⁴³⁹	Set '1/SEER_exist' = 0
For new space conditioning, assume baseline ductless heat pump	16.6 ⁴⁴⁰

LF = Load Factor accounting for DHP operating at partial loads and to calibrate savings to findings from evaluations

= 25%⁴⁴¹

http://www.puc.nh.gov/Electric/Monitoring%20and%20Evaluation%20Reports/National%20Grid/117_RLW_CF%20Res%20RAC.

⁴³⁷ Ibid.

⁴³⁴ EFLH for whole house conditioning are consistent with the Central AC measure (Des Moines EFLH based on Cadmus modeling for the 2011 Joint Assessment and the other locations calculated based on relative Cooling Degree Day ratios (from NCDC)). EFLH for add-on are consistent with Room AC (based on the average ratio of FLH for Room AC (provided in RLW Report: Final Report Coincidence Factor Study Residential Room Air Conditioners, June 23, 2008:

<u>pdf</u>) to FLH for Central Cooling for the same locations (provided by AHRI: see reference file "ENERGY STARCalc_CAC") is 31%. This factor was applied to the ENERGY STAR FLH for Central Cooling provided for Des Moines, IA to provide an assumption for FLH for Room AC, and adjusted by CDD for the other locations.)

⁴³⁵ Note that if only an EER rating is available, a conversion factor of SEER=1.1*EER can be used

⁴³⁶ Average nameplate efficiencies of all Early Replacement qualifying equipment in Ameren IL PY3-PY4 (2010-2012). The utilities should collect this information if possible to inform a future update.

 ⁴³⁸ Estimated by converting the EER assumption using the conversion equation; EER_base = (-0.02 * SEER_base²) + (1.12 * SEER). From Wassmer, M. (2003). A Component-Based Model for Residential Air Conditioner and Heat Pump Energy Calculations. Master's Thesis, University of Colorado at Boulder.

⁴³⁹ If there is no central cooling in place but the incentive encourages installation of a new ASHP with cooling, the added cooling load should be subtracted from any heating benefit.

⁴⁴⁰ Based on average of non-ENERGY STAR qualifying units on AHRI directory. See "AHRI download_0426201.xls" for details.

⁴⁴¹ Factor used by Cadmus, and supported by findings in Cadmus "Ductless Mini-Split Heat Pump Impact Evaluation", December 30, 2016.

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.4.7 Ductless Heat Pumps

For example, installing a 1.5-ton (heating and cooling capacity) ductless heat pump unit rated at 10 HSPF and			
18 SEER in a single-family home in unknown location to displace electric baseboard heat load and replace a			
window air conditioner	, savings are:		
AkWh beat	= ((18000 * 2272 * (1/3.41 – 1/10)) / 1000) * 0.25	= 1975.8 kWh	

∆kWh _{heat}	= ((18000 * 22/2 * (1/3.41 – 1/10)) / 1000) * 0.25	= 1975.8 kWh
ΔkWh_{cool}	= ((18000 * 292 * (1/8 – 1/18))/1000) * 0.25	= 91.3 kWh
∆kWh	= 1975.8 + 91.3	= 2,067kWh

SUMMER COINCIDENT PEAK DEMAND SAVINGS

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.8 Energy Recovery Ventilator

2.4.8 Energy Recovery Ventilator

DESCRIPTION

An energy recovery ventilator saves energy in a home ventilation system by preconditioning incoming air with heated or cooled exhaust air before it is ventilated outside. An ERV is capable of transferring both sensible and latent heat loads. This measure includes the addition of energy recovery equipment on the HVAC system of a newly constructed home. This measure analyzes the heating and cooling savings potential from recovering energy from exhaust air.

This measure was developed to be applicable to the following program types: NC.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient condition is a mechanical ventilation system outfitted with an energy recovery ventilator.

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is a mechanical ventilation system without energy recovery capabilities.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life for the domestic energy recovery equipment is 15 years.⁴⁴⁹

DEEMED MEASURE COST

The actual install cost (including labor) for this measure should be used, if unknown use \$1050.450

DEEMED O&M COST ADJUSTMENTS

There are no expected O&M savings associated with this measure, as compared to the O&M costs of a mechanical ventilation system.

⁴⁵⁰ The average of \$800 and \$1100, the costs associated with average and high efficiency ERVs as per the Minnesota Sustainable Housing Initiative <u>http://www.mnshi.umn.edu/kb/scale/hrverv.html</u>. \$100 was added for incremental installation labor costs.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.8 Energy Recovery Ventilator

Algorithm

CALCULATION OF ENERGY SAVINGS

ELECTRIC ENERGY SAVINGS

 $\Delta kWh = (\Delta kWh_cooling + \Delta kWh_heating)$

ΔkWh_cooling = If central cooling, reduction in annual cooling load due to ERV recovery

For units with cooling capacities less than 65 kBtu/hr:

$$\Delta kWh_{cooling} = \left[\frac{EFLH_{cool} * Capacity_{Cool} * \left(\frac{1}{SEER_{exist}}\right)}{1000}\right] * RF_{cool}$$

For units with cooling capacities equal to or greater than 65 kBtu/hr:

$$\Delta kWh_{cooling} = \left[\frac{EFLH_{cool} * Capacity_{Cool} * \left(\frac{1}{IEER_{exist}}\right)}{1000}\right] * RF_{cool}$$

Where:

EFLH_{cool}

= Equivalent Full load cooling hours

= Dependent on location:⁴⁵¹

Climate Zone	EFLH _{cool} (Hours)		
(City based upon)	Single Family	Manufactured	
(City based upon)	New	New	
Zone 5 (Burlington)	548	508	
Zone 6 (Mason City)	279	259	
Average/ unknown	484	449	

Capacity _{Cool}	= Cooling Capacity of equipment in Btu/hr (note 1 ton = 12,000Btu/hr)
	= Actual installed
SEER _{exist}	= Seasonal Energy Efficiency Ratio of existing unit (kBtu/kWh)
	= Actual installed
IEER _{exist}	= Integrated Energy Efficiency Ratio of existing unit (kBtu/kWh)
	= Actual installed
1000	= Converts Btu to kBtu
RF _{cool}	= Recovery factor, expressed as a percentage of total design load reduction for cooling
	= 9% ⁴⁵²

⁴⁵¹ Full load hours for Des Moines are provided based on Cadmus modeling for the 2011 Joint Assessment. The other locations were calculated based on relative Cooling Degree Day ratios (from NCDC).

⁴⁵² Based on modeling performed for the Minnesota Sustainable Housing Initiative. Results obtained using REM Rate 12.3 based on an 864sf Minnesota code base house, with wood siding, 15% window-to-floor area, window U-value 0.33 and SHGC 0.3, 80 AFUE furnace, and 10 EER air conditioning. Value is assumed to be reasonably applicable for a home in Iowa.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.8 Energy Recovery Ventilator

ΔkWh_heating = If electric heat (resistance or heat pump), reduction in annual electric heating due to ERV recovery

$$\Delta kWh_{heating} = \left[\frac{EFLH_{Heat} * Capacity_{Heat} * \left(\frac{1}{HSPF_{exist}}\right)}{1000}\right] * RF_{heat}$$

Where:

 $\mathsf{EFLH}_{\mathsf{Heat}}$

= Equivalent Full load hours of heating

= Dependent on location:⁴⁵³

Climate Zone	EFLH _{Hea}	t (Hours)
(City based upon)	Single Family New	Manufactured New
Zone 5 (Burlington)	1922	1797
Zone 6 (Mason City)	2732	2554
Average/ unknown	2160	2019

Capacity _{Heat}	= Heating Capacity of equipment in (Btu/hr)
	= Actual (where 1 ton = 12,000Btu/hr)
HSPF _{Exist}	= Heating System Performance Factor of existing heating system (kBtu/kWh)
	= Actual. Note: resistance heat will have an HSPF of 3.412 454
1000	= Converts Btu to kBtu
RF_{heat}	= Recovery factor, expressed as a percentage of total design load reduction for heating
	= 10% ⁴⁵⁵

For example, an ERV installed in a new single family home in Mason City with 3 ton 16 SEER, 12.5 EER, 9 HSPF ducted air source heat pump.

$\Delta kWh_{cooling}$	= ((279 * 36,000 * (1/16))/1000) * 0.09
	= 56.5 kWh
$\Delta kWh_{heating}$	= ((2732 * 36,000 * (1/9))/1000) * 0.10
	= 1092.8 kWh
ΔkWh	= $\Delta kWh_{cooling}$ + $\Delta kWh_{heating}$
	= 56.5 + 1092.8
	=1149.3 kWh

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \frac{\Delta kWh_cooling}{EFLH_{cool}} * CF$$

⁴⁵³ Full load hours for Des Moines are provided based on Cadmus modeling for the 2011 Joint Assessment. The other locations were calculated based on relative Heating Degree Day ratios (from NCDC).

⁴⁵⁵ Based on modeling performed for the Minnesota Sustainable Housing Initiative. Results obtained using REM Rate 12.3 based on an 864sf Minnesota code base house, with wood siding, 15% window-to-floor area, window U-value 0.33 and SHGC 0.3, 80 AFUE furnace, and 10 EER air conditioning. Value is assumed to be reasonably applicable for a home in Iowa.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.8 Energy Recovery Ventilator

Where:

CF

Other factors as defined above.

For example, an ERV installed in a new single family home in Mason City with 3 ton 16 SEER, 12.5 EER, 9 HSPF ducted air source heat pump.		
ΔkW	= 56.5/279 * 0.68	
	= 0.1377 kW	

NATURAL GAS SAVINGS

ΔTherms (if Natural Gas heating)

$$\Delta Therms = \frac{EFLH_{GasHeat} * Capacity_{Heat}}{\eta_{Heat} * 100,000} * RF_{heat}$$

Where:

 $\mathsf{EFLH}_{\mathsf{GasHeat}}$

= Equivalent Full load heating hours

= Dependent on location:⁴⁵⁷

Climate Zone	EFLH (Hours)					
(City based upon)	Single Family New	Single Family Existing	Multifamily New	Multifamily Existing	Manufactured New	Manufactured Existing
Zone 5 (Burlington)	766	883	534	750	651	904
Zone 6 (Mason City)	1090	1253	759	1065	926	1284
Average/ unknown	861	991	601	842	732	1015

 η_{Heat}

= Efficiency of heating system

= Actual⁴⁵⁸

100,000 = Converts Btu to Therms

Other factors as defined above.

⁴⁵⁶ Based on analysis of metering results from homes in Ameren Illinois service territory in PY5; 'Impact and Process Evaluation of Ameren Illinois Company's Residential HVAC Program (PY5)'.

⁴⁵⁷ Full load hours for Des Moines are based on analysis performed by Tetra Tech in April, 2018. Tetra Tech gathered MidAmerican program data from two residential programs with installs between October 2012 to December 2016, and matched them with gas meter consumption data following the install. Regression models were performed to estimate the Normalized Annual Heating (NAH) consumption. EFLH is then estimated by dividing NAH by the units capacity. See "Res Furnace EFLH Findings_30April2018.ppt" for more information. The resulting value of 991 hours for a single family existing home in Des Moines is scaled to other building types using the relative assumptions based upon the Cadmus modeling exercise performed for the 2011 Joint Assessment, and to other climate zones based on relative Heating Degree Day ratios (from NCDC).
⁴⁵⁸ Ideally, the System Efficiency should be obtained either by recording the AFUE of the unit, or performing a steady state efficiency test.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.8 Energy Recovery Ventilator

For example, an ERV installed in a new single family home in Mason City with 90,000Btu, 95% AFUE gas furnace. Δ Therms= ((1090 * 90,000) / (0.95 * 100,000)) * 0.10= 103.3 Therms

PEAK GAS SAVINGS

 Δ PeakTherms = Δ Therms * GCF

Where:

ΔTherms	= Therm impact calculated above
GCF	= Gas Coincidence Factor for Heating ⁴⁵⁹
	= 0.014378 for Residential Boiler
	= 0.016525 for Residential Space Heating (other)

For example, an ERV installed in a new single family home in Mason City with 90,000Btu, 95% AFUE gas furnace.			
∆Therms	= 103.3 * 0.016525		
	= 1.707 Therms

Iowa Energy Efficiency Statewide Technical Reference Manual-2.4.9 Gas Fireplace

2.4.9 Gas Fireplace

DESCRIPTION

This measure characterizes the energy savings from the installation of a new gas fireplace with a 70% AFUE.

This measure was developed to be applicable to the following program types: TOS, RF, NC.

DEFINITION OF EFFICIENT EQUIPMENT

The criterion for this measure is a heat rated gas fireplace with 70%+ AFUE, intermittent ignition, and thermostatic control with blower.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a gas fireplace with <64% AFUE.⁴⁶⁰

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life of a gas fireplace is assumed to be 20 years.⁴⁶¹

DEEMED MEASURE COST

For retrofits, actual material and labor costs should be used. For time of sale and new construction, actual costs may be used if associated baseline costs can also be estimated for the application. If actual costs are unknown, the incremental equipment cost of this measure is \$244 and the incremental installation cost is \$18. Total incremental cost is \$262.⁴⁶²

⁴⁶⁴ Calculated using Cadmus provided Gas Loadshapes as the maximum daily load for the end use.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.10 Whole House Fan

2.4.10 Whole House Fan

DESCRIPTION

A whole house fan can be a simple and inexpensive method of cooling a house. During shoulder seasons, it is possible to reduce or even eliminate the need for air conditioning by operating the fans during periods when outside air is cooler than that inside a home. The fan draws cool outdoor air inside through open windows and exhausts hot indoor air through the attic to the outside. As temperatures rise during the daytime, the fan is turned off and windows are shut to allow the home to "coast" through the hottest part of the day, reducing or eliminating the need for supplemental air conditioning.

The use of timers or thermostatic controls is highly recommended to safeguard against situations that could result in increased energy consumption. For example, prolonged operation of the fan, long after the temperature inside the house has been equalized to temperatures outside could potentially create a situation where more energy is used than would have been by an air conditioning unit.

This measure was developed to be applicable to the following program types: RF, NC, TOS

DEFINITION OF EFFICIENT EQUIPMENT

The efficient condition is a home equipped with a whole house fan. A whole house fan is distinct from an exhaust fan, which may be intended to ventilate specific areas of a home. Whole house fans are installed in the attic and sized to provide 30 to 60 air changes per hour throughout the entire home.

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is a home without a whole house fan that operates an air conditioner during shoulder seasons and periods.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 25 years.⁴⁶⁵

DEEMED MEASURE COST

For all project types, full installation costs should be used for screening purposes.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.11 Central Air Source Heat Pump Tune-Up

2.4.11 Central Air Source Heat Pump Tune-Up

DESCRIPTION

This measure is for the tune-up of a central Air Source Heat Pump (ASHP). The tune-up will improve heat pump performance by inspecting, cleaning, and adjusting the heat pump for correct and efficient operation.

This measure was developed to be applicable to the following program types: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

This measure refers to a tune up of a Central ASHP and should include a thorough cleaning, the measurement of refrigerant charge levels and airflow, correction of any problems found and post-treatment re-measurement.

DEFINITION OF BASELINE EQUIPMENT

The baseline is a residential heat pump (\leq 65,000 Btu/hr) that has not been serviced for at least 3 years.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life for the tune up is assumed to be 3 years.⁴⁶⁷

DEEMED MEASURE COST

The incremental cost for this measure should be the actual cost of tune-up.

⁴⁶⁸ Full load hours for Des Moines are provided based on Cadmus modeling for the 2011 Joint Assessment. The other locations were calculated based on relative Cooling Degree Day ratios (from National Climatic Data Center, NCDC).

⁴⁶⁹ Calculated based on Cadmus report: Savings percent for a refrigerant charged AC unit, Bin Analysis, Energy Savings Impact of Improving the Installation of Residential Central Air Conditioners, 2005

⁴⁷⁰ Use actual SEER rating where it is possible to measure or reasonably estimate. Unknown default of 10 SEER is a VEIC estimate of existing unit efficiency, based on minimum federal standard between the years of 1992 and 2006.

⁴⁷¹ Calculated based on Cadmus report: Savings percent for a refrigerant charged AC unit, Bin Analysis, Energy Savings Impact of Improving the Installation of Residential Central Air Conditioners, 2005

⁴⁷² Full load hours for Des Moines are provided based on Cadmus modeling for the 2011 Joint Assessment. The other locations were calculated based on relative Heating Degree Day ratios (from NCDC).

⁴⁷³ Use actual HSPF rating where it is possible to measure or reasonably estimate. Unknown default of 6.8 HSPF is a VEIC estimate based on minimum Federal Standard between 1992 and 2006.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.11 Central Air Source Heat Pump Tune-Up

For example, for a two ton air source heat pump with rated efficiency of 14 SEER, 12 EER, 9 HSPF undergoing a tune-up in an existing single family home in unknown location: $\Delta kWh = ((811 * 24,000 * 0.075/14)/1000) + ((2,272 * 24,000 * 0.023/9)/1000)$ = 104.3 + 139.3 = 244 kWh

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \left[\frac{RatedCapacity_{Cool} * \left(\frac{SF_{cool}}{RatedEER}\right)}{1000}\right] * CF$$

Where:

RatedEER	= Rated Energy Efficiency Ratio of existing cooling system (kBtu/hr / kW)
	= Use actual EER rating where it is possible to measure or reasonably estimate. If EER unknown but SEER available, convert using the equation:
	EER = (-0.02 * SEER ²) + (1.12 * SEER)
	If using default SEER, EER estimate should be 9.2EER.
CF	= Summer System Peak Coincidence Factor for Cooling
	= 72% ⁴⁷⁴

For example, for a two ton, 14 SEER, 12 EER, 9 HSPF air source heat pump undergoing a tune-up in an existing single family home in unknown location:

ΔkW = (24,000 * 0.075/12)/1000 * 72% = 0.108 kW

WATER IMPACT DESCRIPTIONS AND CALCULATION

N/A

DEEMED O&M COST ADJUSTMENT CALCULATION

While there are likely to be some O&M cost savings due to reduced service calls, increased equipment life, etc., these will only be realized with a regular maintenance schedule, which cannot be assumed for each individual tuneup measure. This benefit is therefore conservatively excluded.

MEASURE CODE: RS-HVC-ATUN-V04-210101

⁴⁷⁴ Based on analysis of metering results from 24 heat pumps in Ameren Illinois service territory in PY5; 'Impact and Process Evaluation of Ameren Illinois Company's Residential HVAC Program (PY5)'.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.12 Central Air Conditioner Tune-Up

2.4.12 Central Air Conditioner Tune-Up

DESCRIPTION

This measure is for the tune-up of a Central Air Conditioner. The tune-up will improve performance by inspecting, cleaning, and adjusting the system for correct and efficient operation.

This measure was developed to be applicable to the following program types: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

This measure refers to a tune up of a Central Air Conditioner and should include a thorough cleaning, the measurement of refrigerant charge levels and airflow, correction of any problems found and post-treatment remeasurement.

Zone 6 (Mason City)	468	375	441		
Average/ unknown	811	650	764		

= Dependent on location:⁴⁷⁶

RatedCapacity_{Cool} = Rated Cooling Capacity (Btu/hr)

	= Actual (where 1 ton = 12,000Btu/hr)
SF _{cool}	= Cooling Savings Factor for CAC tune-ups
	=7.5% ⁴⁷⁷
RatedSEER	= Rated Seasonal Energy Efficiency Ratio of existing cooling system (kBtu/kWh)
	= Actual. If unknown assume 10 SEER ⁴⁷⁸
RatedIEER	= Rated Integrated Energy Efficiency Ratio of existing cooling system (kBtu/kWh)
	= Actual

⁴⁷⁶ Full load hours for Des Moines are provided based on Cadmus modeling for the 2011 Joint Assessment. The other locations were calculated based on relative Cooling Degree Day ratios (from National Climatic Data Center, NCDC).

⁴⁷⁷ Calculated based on Cadmus report: Savings percent for a refrigerant charged AC unit, Bin Analysis, Energy Savings Impact of Improving the Installation of Residential Central Air Conditioners, 2005

⁴⁷⁸ Use actual SEER rating where it is possible to measure or reasonably estimate. Unknown default of 10 SEER is a VEIC estimate of existing unit efficiency, based on minimum federal standard between the years of 1992 and 2006.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.12 Central Air Conditioner Tune-Up

For example, for a three ton CAC unit with rated efficiency 15 SEER, 12 EER undergoing a tune-up in a single family home in unknown location:

= 146 kWh

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \left[\frac{RatedCapacity_{Cool} * \left(\frac{SF_{cool}}{RatedEER}\right)}{1000}\right] * CF$$

Where:

EER= Energy Efficiency Ratio of existing cooling system (kBtu/hr / kW)= Use actual EER rating where it is possible to measure or reasonably estimate. If EER
unknown but SEER available, convert using the equation:EER = (-0.02 * SEER²) + (1.12 * SEER)
If using default SEER, EER estimate should be 9.2EER.CF= Summer System Peak Coincidence Factor for Cooling
= 68%⁴⁷⁹

For example, for a three ton CAC unit with rated efficiency 15 SEER, 12 EER undergoing a tune-up in a single family home in unknown location:

 $\Delta kW = ((36,000 * 0.075/12) / 1000) * 68\%$

= 0.153 kW

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.13 Boiler Tune-up

2.4.13 Boiler Tune-up

DESCRIPTION

This measure is for a residential boiler that provides space heating. The tune-up will improve boiler efficiency by cleaning and/or inspecting burners, combustion chamber, and burner nozzles. Components of tune-up: adjust air flow and reduce excessive stack temperatures; adjust burner and gas input; check venting, safety controls, and adequacy of combustion air intake. Combustion efficiency should be measured before and after tune-up using an electronic flue gas analyzer.

This measure was developed to be applicable to the following program types: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The recommended tune-up requirements are listed below. It is recommended that utility programs require that technicians performing the work are appropriately certified.

- Measure combustion efficiency using an electronic flue gas analyzer.
- Adjust airflow and reduce excessive stack temperatures.
- Adjust burner and gas input, manual or motorized draft control.
- Check for proper venting.
- Complete visual inspection of system piping and insulation.
- Check safety controls.
- Check adequacy of combustion air intake.
- Clean fireside surfaces.
- Inspect all refractory. Patch and wash coat as required.
- Inspect gaskets on front and rear doors and replace as necessary.
- Seal and close front and rear doors properly.
- Clean low and auxiliary low water cut-off controls, then re-install using new gaskets.
- Clean plugs in control piping.
- Remove all hand hole and man hole plates. Flush boiler with water to remove loose scale and sediment.
- Replace all hand hole and man hole plates with new gaskets.
- Open feedwater tank manway, inspect and clean as required. Replace manway plate with new gasket.
- Clean burner and burner pilot.
- Check pilot electrode and adjust or replace.
- Clean air damper and blower assembly.
- Clean motor starter contacts and check operation.
- Make necessary adjustments to burner for proper combustion.
- Perform all flame safeguard and safety trip checks.
- Check all hand hole plates and man hole plates for leaks at normal operating temperatures and pressures.
- Troubleshoot any boiler system problems as requested by on-site personnel.

DEFINITION OF BASELINE EQUIPMENT

The baseline condition of this measure is a boiler that has not had a tune-up within the past 12 months

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.13 Boiler Tune-up

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The life of this measure is 1 year.

DEEMED MEASURE COST

The cost of this measure is the actual tune-up cost.

Capacity	= Boiler gas input size (Btu/hr)
	= Actual
EFLH	=Equivalent Full Load Hours for heating

= Dependent on location:⁴⁸⁰

				EFLH (Hours)		
Climate Zone (City based upon)	Single Family New	Single Family Existing	Multifamily New	Multifamily Existing	Manufactured New	Manufactured Existing
Zone 5 (Burlington)	766	883	534	750	651	904
Zone 6 (Mason City)	1090	1253	759	1065	926	1284
Average/ unknown	861	991	601	842	732	1015

Effbefore

= Combustion efficiency of the boiler before the tune-up⁴⁸¹

⁴⁸⁰ Full load hours for Des Moines are based on analysis performed by Tetra Tech in April, 2018. Tetra Tech gathered MidAmerican program data from two residential programs with installs between October 2012 to December 2016, and matched them with gas meter consumption data following the install. Regression models were performed to estimate the Normalized Annual Heating (NAH) consumption. EFLH is then estimated by dividing NAH by the units capacity. See "Res Furnace EFLH Findings_30April2018.ppt" for more information. The resulting value of 991 hours for a single family existing home in Des Moines is scaled to other building types using the relative assumptions based upon the Cadmus modeling exercise performed for the 2011 Joint Assessment, and to other climate zones based on relative Heating Degree Day ratios (from NCDC).
⁴⁸¹ The percentage improvement in combustion efficiency is deemed a reasonable proxy for the system improvement. If a full thermal efficiency test is performed instead, that should be used.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.13 Boiler Tune-up

⁴⁸² Calculated using Cadmus provided Gas Loadshapes as the maximum daily load for the end use.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.14 Furnace Tune-Up

2.4.14 Furnace Tune-Up

DESCRIPTION

This measure is for the tune-up of a natural gas Residential furnace. The tune-up will improve furnace performance by inspecting, cleaning, and adjusting the furnace and appurtenances for correct and efficient operation. Additional savings maybe realized through a complete system tune-up.

Two savings algorithms are provided for tune-up programs: through the HVAC SAVE program and for other tune-up programs, the difference being how relative efficiencies are measured.

This measure was developed to be applicable to the following program types: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The recommended tune-up requirements are listed below. It is recommended that utility programs require that technicians performing the work are appropriately certified.

- Measure combustion efficiency using an electronic flue gas analyzer.
- Check and clean blower assembly and components per manufacturer's recommendations.
- Where applicable, lubricate motor and inspect and replace fan belt if required.
- Inspect for gas leaks.
- Clean burner per manufacturer's recommendations and adjust as needed.
- Check ignition system and safety systems and clean and adjust as needed.
- Check and clean heat exchanger per manufacturer's recommendations.
- Inspect exhaust/flue for proper attachment and operation.
- Inspect control box, wiring, and controls for proper connections and performance.
- Check air filter and clean or replace per manufacturer's recommendations.
- Inspect duct work connected to furnace for leaks or blockages.
- Measure temperature rise and adjust flow as needed.
- Check for correct line and load volts/amps.
- Check that thermostat operation is per manufacturer's recommendations (if adjustments are made, refer to 'Residential Programmable Thermostat' measure for savings estimate).
- Perform Carbon Monoxide test and adjust heating system until results are within standard industry acceptable limits.

The HVAC SAVE program has its own certifications and requirements. In addition to the maintenance described above, the following are key activities that are provided through an HVAC SAVE maintenance program:⁴⁸³

- Measure pressure drops at return, filter, coil, and supply.
- Determine equipment air flow using OEM blower data or measuring.
- Measure temperature rise across heat exchanger.
- Determine on-rate for a furnace by clocking the clock gas meter.
- Record outdoor temperature & elevation, and complete test-in.
- Clean evaporator coil to OEM pressure drop specification.
- Clean/replace/modify air filter to OEM pressure drop specification.
- Reset air flow based on up design parameter and updated pressure conditions.

⁴⁸³ As provided in ANSI approved ACCA 4 specification for Quality Maintenance.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.14 Furnace Tune-Up

- Adjust/modify gas pressure and venting to OEM specifications.
- Complete final test-out, compare before and after

DEFINITION OF BASELINE EQUIPMENT

The baseline for a clean and check tune-up is a furnace assumed not to have had a tune-up in the past 2 years. HVAC SAVE tune-ups are a one-time measure and cannot be performed more than once on the same piece of equipment. However subsequent clean and check tune-ups can be performed.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life of a clean and check tune-up is 2 years.⁴⁸⁴

An HVAC SAVE tune-up lasts the remaining life of the equipment because they come from adjustments to fans and ducts that remain effective through normal operation of the equipment. Assume 10 years.

DEEMED MEASURE COST

The incremental cost for this measure should be the actual cost of tune-up.

CALCULATION OF ENERGY SAVINGS

ELECTRIC ENERGY SAVINGS

 $\Delta kWh = \Delta Therms * Fe * 29.3$

Where:

ΔTherms	= as calculated below
Fe	= Furnace Fan energy consumption as a percentage of annual fuel consumption
	= 3.14% ⁴⁸⁵
29.3	= kWh per therm

SUMMER COINCIDENT PEAK DEMAND SAVINGS

N/A

NATURAL GAS SAVINGS

1. HVAC SAVE Tune-up Programs:

The HVAC SAVE protocol results in a number of outputs including the measured output capacity of the unit (Btuh), and the adjusted input capacity (Btuh) by recording the gas meter.

⁴⁸⁴ Based on VEIC professional judgment.

 $^{^{485}}$ F_e is not one of the AHRI certified ratings provided for residential furnaces, but can be reasonably estimated from a calculation based on the certified values for fuel energy (Ef in MMBtu/yr) and Eae (kWh/yr). An average of a 300 record sample (non-random) out of 1495 was 3.14%. This is, appropriately, ~50% greater than the ENERGY STAR version 3 criteria for 2% F_e. See "Programmable Thermostats Furnace Fan Analysis.xlsx" for reference.

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.4.14 Furnace Tune-Up

The following algorithm utilizes these outputs to adjust the EFLH of the pre tune-up condition (since the EFLH correspond to a post HVAC SAVE condition) to calculate as site specific savings estimate. There are two limits imposed to using these outputs directly:

1. The post efficiency (i.e., measured output/adjusted input) must not exceed the rated efficiency of the unit. Where the test results indicates an efficiency greater than the rated efficiency, the measured output should be adjusted to equal the value at the rated efficiency.

2. A limit of 15% savings of pre tune-up consumption is applied. Where outputs indicate savings higher than 15%, the program should claim savings at 15%, unless a higher level of independent review is able to justify the higher level of savings.

Note, if a program prefers, a deemed savings percentage can be applied and this is provided as an alternative below.

 $\Delta Therms = ConsumptionPre - ConsumptionPost$

$$\Delta Therms = \frac{\left(\left(CAPInput_{Pre} * EFLH * \left(\frac{CAPOutput_{Post}}{CAPOutput_{Pre}}\right)\right) - (CAPInput_{Post} * EFLH)\right)}{100,000}$$

If using deemed savings percentage:

$$\Delta Therms = \frac{\frac{EFLH * CAPInput}{(1 - Derating_{eff})} * \left(\frac{AFUE * (1 - Derating_{eff})}{AFUE * (1 - Derating_{base})} - 1\right)}{100,000}$$

Where:

CAPInput	= Gas Furnace input capacity (Btuh)
	= Actual rated capacity
CAPInputPre	= Gas Furnace input capacity pre tune-up (Btuh)
	= Measured input capacity from HVAC SAVE
CAPInputPost	= Gas Furnace input capacity post tune-up (Btuh)
	= Measured input capacity from HVAC SAVE
EFLH	=Equivalent Full Load Hours for heating
	= Dependent on location: ⁴⁸⁶

				EFLH (Hours)		
Climate Zone (City based upon)	Single Family New	Single Family Existing	Multifamily New	Multifamily Existing	Manufactured New	Manufactured Existing
Zone 5 (Burlington)	766	883	534	750	651	904
Zone 6 (Mason City)	1090	1253	759	1065	926	1284
Average/ unknown	861	991	601	842	732	1015

⁴⁸⁶ Full load hours for Des Moines are based on analysis performed by Tetra Tech in April, 2018. Tetra Tech gathered MidAmerican program data from two residential programs with installs between October 2012 to December 2016, and matched them with gas meter consumption data following the install. Regression models were performed to estimate the Normalized Annual Heating (NAH) consumption. EFLH is then estimated by dividing NAH by the units capacity. See "Res Furnace EFLH Findings_30April2018.ppt" for more information. The resulting value of 991 hours for a single family existing home in Des Moines is scaled to other building types using the relative assumptions based upon the Cadmus modeling exercise performed for the 2011 Joint Assessment, and to other climate zones based on relative Heating Degree Day ratios (from NCDC).

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.4.14 Furnace Tune-Up

CAPOutputPre	= Measured Output Capacity before HVAC SAVE tune-up (Btuh)
CATOutput _{Post}	= Measured Output Capacity after HVAC SAVE tune-up (Btuh)
AFUE	= Existing Furnace Annual Fuel Utilization Efficiency Rating
	= Actual
Deratingeff	= Furnace AFUE Derating after HVAC SAVE tune-up
	= 0%
Derating _{base}	= Furnace AFUE Derating before HVAC SAVE tune-up
	= 6.4% ⁴⁸⁷
100,000	= Converts Btu to therms

For example, for a furnace tune-up in the HVAC SAVE program in an unknown location single family house with the following outputs: CAPInput_{Pre} = 56,250 Btuh, CAPInput_{Post} = 56,250 Btuh, CAPInput_{Pre} = 44,390 Btuh, CAPInput_{Post} = 51,224 Btu.

ΔTherms = ((56,250 * 991 * (51,224/44,390)) – (56,250 * 991)) /100,000 = 85.8 therms

2. Other Tune-up Programs:

$$\Delta Therms = \frac{CAPInput * EFLH * \left(\frac{(Effbefore + Ei)}{Effbefore} - 1\right)}{100,000}$$

Where:

Effbefore	= Combustion Efficiency of the furnace before the tune-up
	= Actual
EI	= Combustion Efficiency Improvement of the furnace tune-up measure ⁴⁸⁸
	= Actual

For example, for a 100 kBtu furnace in an unknown location single family house that records an efficiency prior to tune-up of 82% AFUE and has a 1.8% improvement in efficiency after tune-up:

$$\Delta$$
Therms = (100,000 * 991 * (((0.82 + 0.018)/ 0.82) - 1)) /100,000
= 21.8 therms

PEAK GAS SAVINGS

 $\Delta PeakTherms = \Delta Therms * GCF$

Where:

ΔTherms	= Therm impact calculated above
GCF	= Gas Coincidence Factor for Heating ⁴⁸⁹

⁴⁸⁷ Based on findings from Building America, US Department of Energy, Brand, Yee and Baker "Improving Gas Furnace Performance: A Field and Laboratory Study at End of Life", February 2015.

⁴⁸⁸ The percentage improvement in combustion efficiency is deemed a reasonable proxy for the system improvement. If a full thermal efficiency test is performed instead, that should be used.

⁴⁸⁹ Calculated using Cadmus provided Gas Loadshapes as the maximum daily load for the end use.

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.4.14 Furnace Tune-Up

= 0.016525 for Residential Space Heating (other)

For example, for a 100 kBtu furnace in an unknown location single family house that records an efficiency prior to tune-up of 82% AFUE and has a 1.8% improvement in efficiency after tune-up:

ΔPeakTherms = 21.8 * 0.016525 = 0.3602 therms

2.4.15 Geothermal Source Heat Pump Tune-Up

NOTE: THIS MEASURE IS EFFECTIVE UNTIL 12/31/2019. IT SHOULD NOT BE USED BEYOND THAT DATE BUT IS LEFT IN THE MANUAL FOR REFERENCE PURPOSES.

DESCRIPTION

This measure is for the tune-up of a Geothermal Source Heat Pump (GSHP). The tune-up will improve heat pump performance by inspecting, cleaning, and adjusting the heat pump for correct and efficient operation.

This measure was developed to be applicable to the following program types: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

This measure refers to tune-ups through the HVAC SAVE program and requires certified technicians adhering to all of the requirements of the program. The following are key activities that are provided through an HVAC SAVE program beyond those of a routine annual maintenance⁴⁹⁰:

- Measure pressure drops at return, filter, coil, and supply.
- Determine equipment air flow using OEM blower data or measuring.
- Measure temperature difference (DB, RH or WB) across equipment.
- Determine the OEM's current capacity rating from expanded tables.
- Record outdoor temperature & elevation, and complete test-in.
- Clean evaporator coil to OEM pressure drop specification.
- Clean/replace/modify air filter to OEM pressure drop specification.
- Reset air flow based on up design parameter and updated pressure conditions.
- Calibrate refrigerant charge.
- Complete final test-out, compare before and after.

DEFINITION OF BASELINE EQUIPMENT

The baseline is a residential heat pump that was installed without Quality Installation and has not already received an HVAC SAVE tune-up.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life of an HVAC SAVE tune-up is the remaining life of the equipment, assume 12 years.

DEEMED MEASURE COST

The incremental cost for this measure should be the actual cost of tune-up.

Iowa Energy Efficiency Statewide Technical Reference Manual-2.4.16 Duct Sealing

2.4.16 Duct Sealing

DESCRIPTION

This measure describes evaluating the savings associated with performing duct sealing using mastic sealant, aerosol, or UL-181 compliant duct sealing tape to the distribution system of homes with either Central Air Conditioner or a ducted heating system. While sealing ducts in conditioned space can help with control and comfort, energy savings are largely limited to sealing ducts in unconditioned space where the heat loss is to outside the thermal envelope. Therefore, for this measure to be applicable, at least 30% of ducts should be within unconditioned space (e.g., attic with floor insulation, vented crawlspace, unheated garages. Basements should be considered conditioned space).

Three methodologies for estimating the savings associate from sealing the ducts are provided.

- Modified Blower Door Subtraction this technique is described in detail on p. 44 of the Energy Conservatory Blower Door Manual; see reference file "Energy Conservatory Blower Door Manual." It involves performing a whole house depressurization test and repeating the test with the ducts excluded.
- 2. Duct Blaster Testing as described in RESNET Test 803.7: http://www.resnet.us/standards/DRAFT_Chapter_8_July_22.pdf This involves using a blower door to pressurize the house to 25 Pascals and pressurizing the duct system using a duct blaster to reach equilibrium with the inside. The air required to reach equilibrium provides a duct leakage estimate.
- **3. Deemed Savings per Linear Foot** this method provides a deemed conservative estimate of savings and should only be used where performance testing described above is not possible.

This measure was developed to be applicable to the following program types: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient condition is sealed duct work throughout the unconditioned space in the home.

DEFINITION OF BASELINE EQUIPMENT

The existing baseline condition is leaky duct work within the unconditioned space in the home.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The assumed lifetime of this measure is 20 years.⁴⁹⁸

DEEMED MEASURE COST

The actual duct sealing measure cost should be used.

LOADSHAPE

Loadshape RE07 – Residential Single Family Cooling

Loadshape RE06 – Residential Single Family Central Heat

Loadshape RE08 – Residential Single Family Heat Pump

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.16 Duct Sealing

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

Methodology 1: Modified Blower Door Subtraction

Claiming Cooling savings from reduction in Air Conditioning Load:

a. Determine Duct Leakage rate before and after performing duct sealing:

 $Duct \ Leakage \ (CFM50_{DL}) \ = \ (CFM50_{Whole \ House} - \ CFM50_{Envelope \ Only}) \ * \ SCF$

Where:

CFM50whole House	= Standard Blower Door test result finding Cubic Feet per Minute at 50 Pascal pressure differential
CFM50Envelope Only	 Blower Door test result finding Cubic Feet per Minute at 50 Pascal pressure differential with all supply and return registers sealed
SCF	= Subtraction Correction Factor to account for underestimation of duct leakage

= Subtraction Correction Factor to account for underestimation of duct leakage due to connections between the duct system and the home. Determined by measuring pressure in duct system with registers sealed and using look up table provided by Energy Conservatory below:

House	Subtraction
to Duct	Correction
Pressure	Factor
50	1.00
49	1.09
48	1.14
47	1.19
46	1.24
45	1.29
44	1.34
43	1.39
42	1.44
41	1.49
40	1.54
39	1.60
38	1.65
37	1.71
36	1.78
35	1.84
34	1.91
33	1.98
32	2.06
31	2.14

House to Duct	Subtraction Correction	
Pressure	Factor	
30	2.23	
29	2.32	
28	2.42	
27	2.52	
26	2.64	
25	2.76	
24	2.89	
23	3.03	
22	3.18	
21	3.35	
20	3.54	
19	3.74	
18	3.97	
17	4.23	
16	4.51	
15	4.83	
14	5.20	
13	5.63	
12	6.12	
11	6.71	

b. Calculate duct leakage reduction, convert to CFM25_{DL}⁴⁹⁹, and factor in Supply and Return Loss Factors:

⁴⁹⁹ 25 Pascals is the standard assumption for typical pressures experienced in the duct system under normal operating conditions.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.16 Duct Sealing

Duct Leakage Reduction ($\Delta CFM25_{DL}$) = (Pre CFM50_{DL} - Post CFM50_{DL}) * 0.64 * (SLF + RLF) Where:

0.64	= Converts CFM50 _{DL} to CFM25 _{DL} ⁵⁰⁰
SLF	= Supply Loss Factor ⁵⁰¹
	= % leaks sealed located in Supply ducts * 1
	Default = 0.5 ⁵⁰²
RLF	= Return Loss Factor ⁵⁰³
	= % leaks sealed located in Return ducts * 0.5
	Default = 0.25 ⁵⁰⁴

c. Calculate Energy Savings:

 $\Delta kWh = \Delta kWh cooling + \Delta kWh Fan$

 $\Delta kWh cooling = \frac{\Delta CFM25_{DL}}{(CapacityCool/12000 * 400)} * EFLH cool * CapacityCool}{1000 * nCool}$

$$\Delta kWhFan = (\Delta Therms * Fe * 29.3)$$

Where:

$\Delta CFM25_{DL}$	= Duct leakage reduction in CFM25
CapacityCool	= Capacity of Air Cooling system (Btu/hr)
	= Actual
12,000	= Converts Btu/H capacity to tons
400	= Conversion of Capacity to CFM (400CFM / ton) 505
EFLHcool	= Equivalent Full Load Cooling Hours
	= Dependent on location: ⁵⁰⁶

⁵⁰⁰ To convert CFM50 to CFM25, multiply by 0.64 (inverse of the "Can't Reach Fifty" factor for CFM25; see Energy Conservatory Blower Door Manual).

⁵⁰¹ Assumes that for each percent of supply air loss there is one percent annual energy penalty. This assumes supply side leaks are direct losses to the outside and are not recaptured back to the house. This could be adjusted downward to reflect regain of usable energy to the house from duct leaks. For example, during the winter some of the energy lost from supply leaks in a crawlspace will probably be regained back to the house (sometimes 1/2 or more may be regained). More information provided in "Appendix E Estimating HVAC System Loss From Duct Airtightness Measurements" from Energy Conservatory Blower Door Manual.

⁵⁰² Assumes 50% of leaks are in supply ducts.

⁵⁰³ Assumes that for each percent of return air loss there is a half percent annual energy penalty. Note that this assumes that return leaks contribute less to energy losses than do supply leaks. This value could be adjusted upward if there was reason to suspect that the return leaks contribute significantly more energy loss than "average" (e.g., pulling return air from a super-heated attic), or can be adjusted downward to represent significantly less energy loss (e.g., pulling return air from a moderate temperature crawl space). More information provided in "Appendix E Estimating HVAC System Loss From Duct Airtightness Measurements" from Energy Conservatory Blower Door Manual.

⁵⁰⁴ Assumes 50% of leaks are in return ducts.

⁵⁰⁵ This conversion is an industry rule of thumb; e.g., see reference file "61-Why 400 CFM per ton."

⁵⁰⁶ Full load hours for Des Moines are provided based on Cadmus modeling for the 2011 Joint Assessment. The other locations

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.4.16 Duct Sealing

1000 = Converts Btu to kBtu

ηCool

- = Efficiency in SEER of Air Conditioning equipment
- = Actual If not available, use:⁵⁰⁷

Equipment Type	Age of Equipment	SEER Estimate
Control AC	Before 2006	10
Central AC	After 2006	13
	Before 2006	10
Heat Pump	2006-2014	13
	2015 on	14

ΔTherms = Therm savings as calculated in Natural Gas Savings

 F_{e}

= Furnace Fan energy consumption as a percentage of annual fuel consumption

= 3.14%⁵⁰⁸

29.3 = kWh per therm

were calculated based on relative Cooling Degree Day ratios (from NCDC).

⁵⁰⁷ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Central AC was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time mean that using the minimum standard is appropriate.

 $^{^{508}}$ F_e is not one of the AHRI certified ratings provided for residential furnaces, but can be reasonably estimated from a calculation based on the certified values for fuel energy (Ef in MMBtu/yr) and Eae (kWh/yr). An average of a 300 record sample (non-random) out of 1495 was 3.14%. This is, appropriately, ~50% greater than the ENERGY STAR version 3 criteria for 2% F_e.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.16 Duct Sealing

• •	ealing in a single family house in Burlington with a 36,000 Btu/H, SEER 11 Central Air E, 105,000 Btu/H natural gas furnace, and the following blower door test results:
Before: CFM50	Whole House = 4800 CFM50
CFM50	Envelope Only = 4500 CFM50
House	to duct pressure of 45 Pascals. = 1.29 SCF (Energy Conservatory look up table)
After: CFM50	Whole House = 4600 CFM50
CFM50	Envelope Only = 4500 CFM50
House	to duct pressure of 43 Pascals = 1.39 SCF (Energy Conservatory look up table)
Duct Leakage:	
CFM50DL before	= (4800 – 4500) * 1.29
	= 387 CFM
CFM50 _{DL after}	= (4600 – 4500) * 1.39
	= 139 CFM
Duct Leakage re	duction at CFM25:
ΔCFM	25 _{DL} = (387 – 139) * 0.64 * (0.5 + 0.25)
	= 119 CFM25
Energy Savings:	
ΔkWh	= [((119 / ((36,000/12,000) * 400)) * 918 * 36,000) / (1000 * 11)] + [51.6 * 0.0314 * 29.3]
	= 297.9 + 47.5
	= 345.4 kWh

Claiming Heating savings for homes with electric heat (Heat Pump):

$$\Delta kWh = \frac{\frac{\Delta CFM25_{DL}}{(CapacityHeat/12000 * 400)} * EFLHelectricheat * CapacityHeat}{nHeat * 3412}$$

Where:

	= Duct leakage reduction in CFM25
CapacityHeat	= Heating output capacity (Btu/hr) of electric heat
	= Actual

EFLHelectricheat = Equivalent Full Load Heating Hours for ASHP

= Dependent on location:⁵⁰⁹

Climate Zone	EFLHelectricheat			
(City based upon)	Single Family Existing	Multifamily Existing	Manufactured Existing	
Zone 5 (Burlington)	2022	1643	2137	
Zone 6 (Mason City)	2874	2335	3037	
Average/ unknown	2272	1846	2401	

⁵⁰⁹ Full load hours for Des Moines are provided based on Cadmus modeling for the 2011 Joint Assessment. The other locations were calculated based on relative Heating Degree Day ratios (from NCDC).

Iowa Energy Efficiency Statewide Technical Reference Manual-2.4.16 Duct Sealing

ηHeat

= Efficiency in COP of Heating equipment

= Actual – If not available, use:⁵¹⁰

System Type	Age of Equipment	HSPF Estimate	ηHeat (COP Estimate)
Heat Pump	Before 2006	6.8	2.00
	2006-2014	7.7	2.26
	2015 and after	8.2	2.40

3412	= Converts Btu to kWh
------	-----------------------

For example, for duct sealing in a 36,000 Btu/H 2.5 COP heat pump heated single family house in Burlington with the blower door results in the example described above:

 $\Delta kWh_{heating} = ((119 / ((36,000/12,000) * 400)) * 2022 * 36,000) / (2.5 * 3412)$ = 846.3 kWh

Methodology 2: Duct Blaster Testing

Claiming Cooling savings from reduction in Air Conditioning Load:

 $\Delta kWh = \Delta kWh cooling + \Delta kWh Fan$

 $\Delta kWh cooling = \frac{\frac{Pre_CFM25 - Post_CFM25}{CapacityCool/12000 * 400} * EFLH cool * CapacityCool}{1000 * \eta Cool}$

 $\Delta kWhFan = (\Delta Therms * Fe * 29.3)$

Where:

Pre_CFM25 = Duct leakage in CFM25 as measured by duct blaster test before sealing

Post_CFM25 = Duct leakage in CFM25 as measured by duct blaster test after sealing

All other variables as provided above

For example, for duct sealing in a single family house in Burlington with a 36,000 Btu/H, SEER 11 Central Air
Conditioner, an 80% AFUE, 105,000 Btu/H natural gas furnace, and the following duct blaster test results:Pre_CFM25= 220 CFM25Post_CFM25= 80 CFM25 ΔkWh = [(((220 - 80) / (36000/12000 * 400)) * 918 * 36000) / (1000 * 11)] + [60.7 *
0.0314 * 29.3]= 350.5 + 55.8= 406.3 kWh

Claiming Heating savings for homes with electric heat (Heat Pump):

 $\Delta kWhheating = \frac{\frac{Pre_CFM25 - Post_CFM25}{CapacityCool/12000 * 400} * EFLHelectricheat * CapacityHeat}{\eta Heat * 3412}$

⁵¹⁰ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Heat Pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.16 Duct Sealing

Where:

All other variables as provided above

For example, for duct sealing in a 36,000 Btu/H 2.5 COP heat pump heated single family house in Burlington with the duct blaster results described in the example above:

ΔkWh_{heating} = (((220 - 80) / (36000/12000 * 400)) * 2022 * 36000) / (2.5 * 3412) = 995.6 kWh

Methodology 3: Deemed Savings⁵¹¹

Claiming Cooling savings from reduction in Air Conditioning Load:

 $\Delta kWh = \Delta kWh cooling + \Delta kWh Fan$ $\Delta kWh cooling = Cool Savings Per Unit * Duct_{Length}$ $\Delta kWh Fan = (\Delta Therms * Fe * 29.3)$

Where:

CoolSavingsPerUnit

= Annual cooling savings per linear foot of duct

Building Type	HVAC System	CoolSavingsPerUnit (kWh/ft)
Manufactured	Cool Central	0.95
Multifamily	Cool Central	0.70
Single-family	Cool Central	0.81
Manufactured	Heat Pump—Cooling	0.95
Multifamily	Heat Pump—Cooling	0.70
Single-family	Heat Pump—Cooling	0.81

DuctLength

= Total linear feet of duct within the home

= Actual. If unavailable a default of 142ft for single family, 92 ft for Multifamily or 100 ft for manufactured homes can be used.⁵¹²

Claiming Heating savings for homes with electric heat (Heat Pump):

 $\Delta kWhheating = HeatSavingsPerUnit * Duct_{Length}$

Where:

HeatSavingsPerUnit

= Annual heating savings per linear foot of duct

Building Type	HVAC System	HeatSavingsPerUnit (kWh/ft)
Manufactured	Heat Pump—Cooling	5.06
Multifamily	Heat Pump—Cooling	3.41
Single-family	Heat Pump—Cooling	4.11

⁵¹¹ Savings per unit are based upon analysis performed by Cadmus for the 2011 Joint Assessment of Potential. It was based on 10% savings in system efficiency (ENERGY STAR suggests savings potential of up to 20% on its website). This would represent savings from homes with significant duct work outside of the thermal envelope. With no performance testing or verification, a deemed savings value should be very conservative and therefore the values provided in this section represent half of the savings – or 5% improvement.

⁵¹² Based upon Cadmus developed estimate using REMRate assumption of duct surface area to range from 10-15% of conditioned floor area, 6" and 8" duct diameter and square footage based on IUA 2011 Assessment of Potential.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.16 Duct Sealing

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \frac{\Delta kWh cooling}{EFLH cool} * CF$$

Where:

EFLHcool

= Equivalent Full load cooling hours:

= Dependent on location:⁵¹³

Climate Zone	EFLHcool			
(City based upon)	Single Family	Multifamily	Manufactured	
Zone 5 (Burlington)	918	736	865	
Zone 6 (Mason City)	468	375	441	
Average/ unknown	811	650	764	

CF

= Summer System Peak Coincidence Factor for Cooling

= 68% if central AC, 72% if ducted ASHP⁵¹⁴

NATURAL GAS SAVINGS

For homes with Natural Gas Heating:

Methodology 1: Modified Blower Door Subtraction

$$\Delta Therm = \frac{\Delta CFM25_{DL}}{CapacityHeat * 0.0136} * EFLHgasheat * CapacityHeat * \frac{\eta Equipment}{\eta System}}{100.000}$$

Where:

ΔCFM25 _{DL}	= Duct leakage reduction in CFM25
	= As calculated in Methodology 1 under electric savings
CapacityHeat	= Heating input capacity (Btu/hr)
	= Actual
0.0136	= Conversion of Capacity to CFM (0.0136CFM / Btu/hr) ⁵¹⁵
EFLHgasheat	= Equivalent Full load heating hours for Furnaces
	= Dependent on location: ⁵¹⁶

⁵¹³ Full load hours for Des Moines are provided based on Cadmus modeling for the 2011 Joint Assessment. The other locations were calculated based on relative Cooling Degree Day ratios (from NCDC).

⁵¹⁴ Based on analysis of metering results from homes in Ameren Illinois service territory in PY5; 'Impact and Process Evaluation of Ameren Illinois Company's Residential HVAC Program (PY5)'.

⁵¹⁵ Based on Natural Draft Furnaces requiring 100 CFM per 10,000 Btu, Induced Draft Furnaces requiring 130CFM per 10,000Btu and Condensing Furnaces requiring 150 CFM per 10,000 Btu (rule of thumb from

http://contractingbusiness.com/enewsletters/cb_imp_43580/). Data provided by GAMA during the federal rule-making process for furnace efficiency standards, suggested that in 2000, 60% of furnaces purchased in Illinois were condensing units. Therefore a weighted average required airflow rate is calculated assuming a 50:50 split of natural v induced draft non-condensing furnaces, as 123 per 10,000Btu or 0.0136/Btu.

⁵¹⁶ To calculate the EFLH for an average home as opposed to one with a high efficiency that has been installed using HVAC

Iowa Energy Efficiency Statewide Technical Reference Manual-2.4.16 Duct Sealing

	EFLH (Hours)					
Climate Zone (City based upon)	Single Family New	Single Family Existing	Multifamily New	Multifamily Existing	Manufactured New	Manufactured Existing
Zone 5 (Burlington)	915	1054	638	896	777	1079
Zone 6 (Mason City)	1302	1496	906	1272	1106	1533
Average/ unknown	1028	1183	718	1005	874	1212

ηEquipment	= Heating Equipment Efficiency
	= Actual ⁵¹⁷ – If not available, use 87% ⁵¹⁸
ηSystem	= Pre duct sealing Heating System Efficiency (Equipment Efficiency * Pre Distribution Efficiency) ⁵¹⁹
	= Actual – If not available use 74% ⁵²⁰
100,000	= Converts Btu to therms

SAVE, the EFLH developed by TetraTech (see Furnace measure for reference) are adjusted to account for a lower AFUE (85% v 95%) and to derate the AFUE by the factor used for a non-QI furnace. See 'Adjusting EFLH for 'average' home'.xls for more information.

⁵¹⁷ The Equipment Efficiency can be obtained either by recording the AFUE of the unit, or performing a steady state efficiency test.

If there is more than one heating system, the weighted (by consumption) average efficiency should be used.

If the heating system or distribution is being upgraded within a package of measures together with the insulation upgrade, the new average heating system efficiency should be used.

 $^{^{518}}$ In 2000, 60% of furnaces purchased in Iowa were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the state. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: (0.60*0.92) + (0.40*0.8) = 0.872.

⁵¹⁹ The Distribution Efficiency can be estimated via a visual inspection and by referring to a look-up table such as that provided by the Building Performance Institute: (<u>http://www.bpi.org/files/pdf/DistributionEfficiencyTable-BlueSheet.pdf</u>) or by performing duct blaster testing.

⁵²⁰ Estimated as follows: 0.872 * (1-0.15) = 0.74.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.16 Duct Sealing

For example , for duct sealing in a house in Burlington with an 80% AFUE, 105,000 Btu/H (input capacity) natur gas furnace and the following blower door test results:	ral
Before: CFM50 _{whole House} = 4800 CFM50	
CFM50 _{Envelope Only} = 4500CFM50	
House to duct pressure of 45 Pascals = 1.29 SCF (Energy Conservatory look up table)	
After: CFM50whole House = 4600 CFM50	
CFM50 _{Envelope Only} = 4500CFM50	
House to duct pressure of 43 Pascals = 1.39 SCF (Energy Conservatory look up table)	
Duct Leakage:	
$CFM50_{DL before} = (4800 - 4500) * 1.29$	
= 387 CFM	
$CFM50_{DL after} = (4600 - 4500) * 1.39$	
= 139 CFM	
Duct Leakage reduction at CFM25:	
$\Delta CFM25_{DL}$ = (387 – 139) * 0.64 * (0.5 + 0.25)	
= 119 CFM25	
Energy Savings:	
Pre Distribution Efficiency = $1 - (387/4800) = 92\%$	
ηSystem = 80% * 92% = 74%	
ΔTherm = ((119/ (105,000 * 0.0136)) * 1054 * 105,000 * (0.8/0.74)) / 100,000	
= 99.7 therms	

Methodology 2: Duct Blaster Testing

$$\Delta Therms = \frac{\frac{Pre_CFM25 - Post_CFM25}{CapacityHeat * 0.0136} * EFLHgasheat * CapacityHeat * \frac{\eta Equipment}{\eta System}}{100,000}$$

Where:

All variables as provided above

For example , for duct sealing in a single family house in Burlington with a 36,000 Btu/H, SEER 11 Central Air Conditioner, an 80% AFUE, 105,000 Btu/H natural gas furnace and the following duct blaster test results:					
Pre_CFN	Pre_CFM25 = 220 CFM25				
Post_CFM25		FM25			
Δ Therms = (((220 - 80)/(105,000 * 0.0136)) * 1054 * 105,000 * (0.8/0.74)) / 100,000					
	= 117.3 therms				

Methodology 3: Deemed Savings⁵²¹

 $\Delta Therms = HeatSavingsPerUnit * Duct_{Length}$

⁵²¹ Savings per unit are based upon analysis performed by Cadmus for the 2011 Joint Assessment of Potential. It was based on 10% savings in system efficiency (ENERGY STAR suggests savings potential of up to 20% on its website). This would represent savings from homes with significant duct work outside of the thermal envelope. With no performance testing or verification, a deemed savings value should be very conservative and therefore the values provided in this section represent half of the savings – or 5% improvement.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.16 Duct Sealing

Where:

HeatSavingsPerUnit

= Annual heating savings per linear foot of duct

Building Type	HVAC System	HeatSavingsPerUnit (Therms/ft)
Manufactured	Heat Central Furnace	0.26
Multifamily	Heat Central Furnace	0.19
Single-family	Heat Central Furnace	0.21

PEAK GAS SAVINGS

 $\Delta PeakTherms = \Delta Therms * GCF$

Where:

∆Therms	= Therm impact calculated above
GCF	= Gas Coincidence Factor for Heating ⁵²²
	= 0.016525 for Residential Space Heating (other)

For example, for duct sealing in a single family house in Burlington with a 36,000 Btu/H, SEER 11 Central Air Conditioner, an 80% AFUE, 105,000 Btu/H natural gas furnace, and the following duct blaster test results:

Pre_CFM25	= 220 CFM25
Post_CFM25	= 80 CFM25

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.17 Programmable Thermostats

2.4.17 Programmable Thermostats

DESCRIPTION

This measure characterizes the household energy savings from the installation of a new standard Programmable Thermostat for reduced heating energy consumption through temperature set-back during unoccupied or reduced demand times. Because a literature review was not conclusive in providing a defensible source of prescriptive cooling savings from standard programmable thermostats, cooling savings are assumed to be zero for this version of the measure.

Energy savings are applicable at the household level; all thermostats controlling household heat should be programmable and installation of multiple programmable thermostats per home does not accrue additional savings.

If the home has a Heat Pump, a programmable thermostat specifically designed for heat pumps should be used to minimize the use of backup electric resistance heat systems.

This measure was developed to be applicable to the following program types: RF, DI, TOS.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The criteria for this measure are established by replacement of a manual-only temperature control with one that has the capability to adjust temperature setpoints according to a schedule without manual intervention.

DEFINITION OF BASELINE EQUIPMENT

For new thermostats the baseline is a non-programmable thermostat requiring manual intervention to change temperature set point.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life of a programmable thermostat is assumed to be 8 years.⁵²³

DEEMED MEASURE COST

Actual material and labor costs should be used if the implementation method allows. If unknown (e.g., through a retail program), the capital cost for the new installation is assumed to be \$70.⁵²⁴

LOADSHAPE

Loadshape RE06 – Residential Single Family Central Heat

Loadshape RE08 – Residential Single Family Heat Pump

- Loadshape RG01 Residential Boiler
- Loadshape RG04 Residential Other Heating

⁵²³ 8 years is based upon ASHRAE Applications (2003), Section 36, Table 3 estimate of 16 years for the equipment life, reduced by 50% to account for persistence issues.

⁵²⁴ Market prices vary significantly in this category, generally increasing with thermostat capability and sophistication. The basic functions required by this measure's eligibility criteria are available on units readily available in the market for \$30. Labor is assumed to be one hour at \$40 per hour.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.17 Programmable Thermostats

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

 $\Delta kWh^{525} = (\% ElectricHeat * Elec_{Heating_{Consumption}} * \% Controlled * Heating_{Reduction} * Eff_{ISR}) + (\Delta Therms * Fe * 29.3)$

Where:

%ElectricHeat

at = Percentage of heating savings assumed to be electric

Heating fuel	%ElectricHeat
Controllable Electric Heat (i.e., ducted ASHP or GSHP)	100%
Natural Gas	0%
Unknown	6% ⁵²⁶

Elec_Heating_ Consumption

= Estimate of annual household heating consumption for electrically heated homes.⁵²⁷ If location and heating type is unknown, assume 10,599 kWh.⁵²⁸

		Elec_Heating_ Consumption (kWH) by Climate Zone (City based upon)		
Heating System ⁵²⁹	Building Type	Zone 5 (Burlington)	Zone 6 (Mason City)	Average/ unknown
Air-Source Heat	Manufactured	9,031	12,838	10,148
	Multifamily	5,576	7,927	6,266

⁵³⁰ RECS Table HC6.9 Space Heating in U.S. Homes in Midwest Region, Divisions, and States, 2009, indicates that 14% of homes have two or more thermostats in the region. If it is unknown the total heat consumption per thermostat is reduced by 7%, assuming that the 14% are controlling 50% of the homes total consumption. 2015 Residential Energy Consumption Data was not used as it does not have the geographical specificity that is provided in 2009.

⁵³¹ The savings from programmable thermostats are highly susceptible to many factors best addressed, so far for this category, by a study that controlled for the most significant issues with a very large sample size; RLW Analytics, 2007 "Validating the Impact of Programmable Thermostats", 2007. To the extent that the treatment group is representative of the program participants for IA, this value is suitable. Higher and lower values would be justified based upon clear dissimilarities due to program and product attributes. Future evaluation work should assess program specific impacts associated with penetration rates, baseline levels, persistence, and other factors which this value represents.

⁵³²"Programmable Thermostats. Report to KeySpan Energy Delivery on Energy Savings and Cost Effectiveness," GDS Associates, Marietta, GA. 2002GDS

⁵³³ F_e is not one of the AHRI certified ratings provided for residential furnaces, but can be reasonably estimated from a calculation based on the certified values for fuel energy (Ef in MMBtu/yr) and Eae (kWh/yr). An average of a 300 record sample (non-random) out of 1495 was 3.14%. This is, appropriately, ~50% greater than the ENERGY STAR version 3 criteria for 2% F_e. See "Programmable Thermostats Furnace Fan Analysis.xlsx" for reference.

⁵³⁴ See "Programmable Thermostat Savings_03252019.xls" for calculation detail.

⁵³⁵ Assumes single zone. If not – adjust accordingly.

Iowa Energy Efficiency Statewide Technical Reference Manual -2.4.18 Advanced Thermostats

2.4.18 Advanced Thermostats

DESCRIPTION

This measure characterizes the household energy savings from the installation of a new thermostat(s) for reduced heating and cooling consumption through a configurable schedule of temperature setpoints (like a programmable thermostat) and automatic variations to that schedule to better match HVAC system runtimes to meet occupant comfort needs. These schedules may be defaults, established through user interaction, and be changed manually at the device or remotely through a web or mobile app. Automatic variations to that schedule could be driven by local sensors and software algorithms, and/or through connectivity to an internet software service. Data triggers to automatic schedule changes might include, for example: occupancy/activity detection, arrival & departure within conditioned spaces, optimization based on historical or population-specific trends, weather data and forecasts.⁵⁴³ This class of products and services are relatively new, diverse, and rapidly changing. Generally, the savings expected for this measure aren't yet established at the level of individual features, but rather at the system level and how it performs overall. Like programmable thermostats, it is not suitable to assume that heating and cooling savings follow a similar pattern of usage and savings opportunity, and so here too this measure treats these savings independently. Note that it is a very active area of ongoing study to better map features to savings value and establish standards of performance measurement based on field data so that a standard of efficiency can be developed.⁵⁴⁴ That work is not yet complete but does inform the treatment of some aspects of this characterization and recommendations. Energy savings are applicable at the household level; all thermostats controlling household heat should be programmable and installation of multiple advanced thermostats per home does not accrue additional savings.

Note that though these devices and service could potentially be used as part of a demand response program, the costs, delivery, impacts, and other aspects of DR-specific program delivery are not included in this characterization at this time, though they could be added in the future.

This measure was developed to be applicable to the following program types: TOS, NC, RF, DI.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The criteria for this measure are established by replacement of a manual-only or programmable thermostat, with an ENERGY STAR qualified Advanced Thermostat, with the default enabled capability—or the capability to automatically—a schedule of temperature setpoints according to driving device inputs above and beyond basic time and temperature data of conventional programmable thermostats. As summarized in the description, this category of products and services is broad and rapidly advancing in regard to their capability, usability, and sophistication, but at a minimum must be capable of two-way communication⁵⁴⁵ and exceed the typical performance of manual and conventional programmable thermostats through the automatic or default capabilities described above.

DEFINITION OF BASELINE EQUIPMENT

The baseline is either the actual type (manual or programmable) if it is known,⁵⁴⁶ or an assumed mix of these two

⁵⁴³ For example, the capabilities of products and added services that use ultrasound, infrared, or geofencing sensor systems, automatically develop individual models of home's thermal properties through user interaction and optimize system operation based on equipment type and performance traits based on weather forecasts demonstrate the type of automatic schedule change functionality that apply to this measure characterization.

⁵⁴⁴ The ENERGY STAR program discontinued its support for basic programmable thermostats effective 12/31/09, and is presently developing a new specification for 'Residential Climate Controls'.

⁵⁴⁵ This measure recognizes that field data may be available, through this 2-way communication capability, to better inform characterization of efficiency criteria and savings calculations. It is recommended that program implementations incorporate this data into their planning and operation activities to improve understanding of the measure to manage risks and enhance savings results.

⁵⁴⁶ If the actual thermostat is a programmable and it is found to be used in override mode or otherwise effectively being

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.4.18 Advanced Thermostats

types based upon information available from evaluations or surveys that represent the population of program participants. This mix may vary by program, but as a default, 44% programmable and 56% manual thermostats may be assumed.⁵⁴⁷

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life for advanced thermostats is assumed to be similar to that of a programmable thermostat 10 years⁵⁴⁸ based upon equipment life only.⁵⁴⁹

DEEMED MEASURE COST

For DI and other programs for which installation services are provided, the actual material, labor, and other costs should be used. For retail, BYOT, or other program types, actual costs should be used if available,⁵⁵⁰ along with a baseline equipment cost of \$50. If actual costs are unknown, then the average incremental cost for the new installation measure is assumed to be \$125.⁵⁵¹

LOADSHAPE

∆kWh ∆kWh _{heating}	 → RE08 – Residential Single Family Heat Pump → RE06 – Residential Single Family Central Heat → RE01 – Residential Multifermity Central Heat
$\Delta kWh_{cooling}$	 → RE01 – Residential Multifamily Central Heat → RE07 – Residential Single Family Cooling → RE02 – Residential Multifamily Cooling
ΔTherms	 → RG02 – Residential Boiler → RG04 – Residential Other Heating

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

	$\Delta kWh = \Delta kWh_{heat} + \Delta kWh_{cool}$
ΔkWh_{heat}	= %ElectricHeat * Elec_Heating_Consumption * %Controlled * Heating_Reduction * HF * Eff_ISR + (ΔTherms * Fe * 29.3)
ΔkWh_{cool}	= %AC * ((EFLH _{cool} * Capacity _{cool} * 1/SEERbase)/1000) * %Controlled * Cooling_Reduction * Eff_ISR

Where:

%ElectricHeat = Percentage of heating savings assumed to be electric

operated like a manual thermostat, then the baseline may be considered to be a manual thermostat

⁵⁴⁷ Value for blend of baseline thermostats comes from an IL Potential Study conducted by ComEd in 2013

⁵⁴⁸ Table 1, HVAC Controls, Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, 2007

⁵⁴⁹ Future evaluation is strongly encouraged to inform the persistence of savings to further refine measure life assumption. As this characterization depends heavily upon a number of savings studies that only lasted a single year or less, the longer term impacts should be assessed.

⁵⁵⁰ Including any one-time software integration or annual software maintenance, and or individual device energy feature fees.
⁵⁵¹ ENERGY STAR models are currently being offered in the \$150-\$200 range. The assumed incremental cost is based on the middle of this range (\$175) minus a cost of \$50 for the baseline equipment blend of manual and programmable thermostats. Note that any add-on energy service costs, which may include one-time setup and/or annual per device costs are not included in this assumption.

Iowa Energy Efficiency Statewide Technical Reference Manual -2.4.18 Advanced Thermostats

Heating fuel	%ElectricHeat
Controllable Electric Heat	
(i.e., ducted ASHP, GSHP or	100%
forced air electric furnace)	
Natural Gas	0%
Unknown	6% ⁵⁵²

Elec_Heating_Consumption

= Estimate of annual household heating consumption for electrically heated single-family homes.⁵⁵³ If location and heating type is unknown, assume 11,407 kWh.⁵⁵⁴

		Elec_Heating_ Consumption (kWH) by Climate Zone (City based upon)			
Heating System ⁵⁵⁵	Building Type	Zone 5 (Burlington)	Zone 6 (Mason City)	Average/ unknown	
	Manufactured	9,031	12,838	10,148	
Air-Source Heat Pump	Multifamily	5,576	7,927	6,266	
	Single-family	10,396	14,778	11,682	
	Manufactured	5,247	7,459	5,896	
Ground-Source Heat Pump	Multifamily	3,234	4,597	3,634	
	Single-family	6,029	8,571	6,775	
	Manufactured	11,325	16,098	12,725	
Forced Air Electric Furnace	Multifamily	7,619	10,830	8,561	
	Single-family	12,454	17,703	13,994	

%Controlled = Assumed percentage of household heating consumption that is controlled by the thermostat

- = If single zone, assume 100%
- = If single zone thermostat in multi zone home, assume 1 / # zones
- = If multi zone thermostat, assume 100%
- = If unknown, assume 93%⁵⁵⁶

Heating_Reduction = Assumed percentage reduction in total household heating energy consumption due to advanced thermostat

⁵⁵² Average (default) value of 6% electric ducted heat pump space heating from 2009 Residential Energy Consumption Survey for lowa (note advanced thermostats are unlikely to be applied to resistance heating or ductless heat pumps). Note Dunsky and Opinion Dynamics Baseline Study results indicate 17% electric, though the proportion of that that could be controlled (i.e. not resistance) is not clear. If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area, then they should be used.

⁵⁵³ Based on Cadmus modeling performed for the 2011 Joint Assessment.

⁵⁵⁴ Assumes 65% Air Source Heat Pump consumption value, 35% Forced Air Electric Furnace (data provided by Cedar Falls Utility program) and 80% Single Family and 20% Multi Family (based on 2009 Residential Energy Consumption Survey for Iowa), see "HC2.9 Structural and Geographic in Midwest Region.xls".

⁵⁵⁵ If the home has a Heat Pump, a programmable thermostat specifically designed for heat pumps should be used to minimize the use of backup electric resistance heat systems.

⁵⁵⁶ RECS Table HC6.9 Space Heating in U.S. Homes in Midwest Region, Divisions, and States, 2009, indicates that 14% of homes have two or more thermostats in the region. If it is unknown the total heat consumption per thermostat is reduced by 7%, assuming that the 14% are controlling 50% of the home's total consumption.

= If programs are evaluated during program deployment then custom savings assumptions should be applied. Otherwise use:

Existing Thermostat Type	Heating_Reduction ⁵⁵⁷
Manual	8.8%
Programmable	5.6%
Unknown (Blended)	6.8%

ΗF

= Household factor, to adjust heating consumption for non-single-family households.

Household Type	HF
Single-Family	100%
Multifamily	65% ⁵⁵⁸
Actual	Custom ⁵⁵⁹

Eff_ISR = Effective In-Service Rate, the percentage of thermostats installed and configured effectively for 2-way communication

= If programs are evaluated during program deployment then custom ISR assumptions should be applied. If in service rate is captured within the savings percentage, ISR should be 100%. If using default savings:

Program Delivery	Eff_ISR
Direct Install	100%
Other	100% ⁵⁶⁰

ΔTherms	= Therm savings if Natural Gas heating system
	= See calculation in Natural Gas section below
Fe	= Furnace Fan energy consumption as a percentage of annual fuel consumption
	= 3.14% ⁵⁶¹
29.3	= kWh per therm
%AC	= Fraction of customers with thermostat-controlled air-conditioning

⁵⁵⁷ These values represent adjusted baseline savings values for different existing thermostats as presented in Navigant's IL TRM Workpaper on Impact Analysis from Preliminary Gas savings findings (page 28). The unknown assumption is calculated by multiplying the savings for manual and programmable thermostats by their respective share of baseline, based upon results from the Dunsky and Opinion Dynamics 2017 Baseline Study.

⁵⁵⁸ Multifamily household heating consumption relative to single-family households is affected by overall household square footage and exposure to the exterior. This 65% reduction factor is applied to MF homes with electric resistance, based on professional judgment that average household size, and heat loads of MF households are smaller than single-family homes ⁵⁵⁹ Program-specific household factors may be utilized on the basis of sufficiently validated program evaluations.

⁵⁶⁰ As a function of the method for determining savings impact of these devices, in-service rate effects are already incorporated into the savings value for heating reduction above.

 $^{^{561}}$ F_e is not one of the AHRI certified ratings provided for residential furnaces but can be reasonably estimated from a calculation based on the certified values for fuel energy (Ef in MMBTU/yr) and Eae (kWh/yr). An average of a 300 record sample (non-random) out of 1495 was 3.14%. This is, appropriately, ~50% greater than the Energy Star version 3 criteria for 2% F_e. See "Programmable Thermostats Furnace Fan Analysis.xlsx" for reference.

Iowa Energy Efficiency Statewide Technical Reference Manual -2.4.18 Advanced Thermostats

Thermostat control of air conditioning?	%AC	
Yes	100%	
No	0%	
Unknown	Actual population	
UTKIOWI	data, or 88% ⁵⁶²	

EFLH_{cool} = Estimate of annual household full load cooling hours for air conditioning equipment based on location and home type. If location and cooling type are unknown, assume the weighted average.

Climate Zone	FLH (Hours)					
(City based upon)	Single Family	Single Family	Multifamily	Multifamily	Manufactured	Manufactured
(City based upon)	New	Existing	New	Existing	New	Existing
Zone 5 (Burlington)	548	918	504	736	508	865
Zone 6 (Mason City)	279	468	257	375	259	441
Average/ unknown	484	811	445	650	449	764

Capacity _{cool}	= Cooling Capacity of new equipment in Btu/hr (note 1 ton = 12,000Btu/hr)		
	= Actua	l installed – If actual size unknown, assume 36,000	
SEERbase	= Seaso	nal Energy Efficiency Ratio of baseline unit (kBtu/kWh)	
	= 13 ⁵⁶³		
1/1000	= kBtu	per Btu	
Cooling_Reduct	ion	= Assumed percentage reduction in total household cooling energy consumption due to installation of advanced thermostat	
		= If programs are evaluated during program deployment then custom savings assumptions should be applied. Otherwise use:	
		= 8.0% ⁵⁶⁴	

For example, an advanced thermostat replacing a programmable thermostat directly installed in a single zone air source heat pump heated, single-family home in Mason City with advanced thermostat-controlled air conditioning of a system of unknown size and seasonal efficiency rating:

ΔkWH = ΔkWh_{heating} + ΔkWh_{cooling} = ((1 * 14,778 * 5.6% * 100% * 100%) + (0 * 3.14% * 29.3)) + (100% * ((468 * 36,000 * (1/13))/1000) * 8% * 100%) = 828 + 104 = 932 kWh

⁵⁶³ Based on Minimum Federal Standard;

⁵⁶² 88% of homes have central cooling (based on Dunsky and Opinion Dynamics Baseline Study results).

http://www1.eere.energy.gov/buildings/appliance_standards/residential/residential_cac_hp.html.

⁵⁶⁴ Note: This factor represents estimated savings as a percentage of cooling consumption. When reviewing against factors from other evaluations, it is important to understand whether savings percentages are applied against cooling, cooling and heating fan or total annual household kWh. 8% is consistent with the Illinois TRM assumption pending an upcoming statewide advanced thermostat evaluation utilizing participant AMI data. Further evaluation and regular review of this key assumption is encouraged.

Iowa Energy Efficiency Statewide Technical Reference Manual -2.4.18 Advanced Thermostats

SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = \%AC * (\%Controlled * Cooling_Reduction * Capacity_{cool} * (1/EER))/1000 * Eff_ISR * CF$

Where:

EER

= Energy Efficiency Ratio of existing cooling system (kBtu/hr / kW)

= Use actual EER rating where it is possible to measure or reasonably estimate. If EER unknown but SEER available convert using the equation:⁵⁶⁵

 $EER = (-0.02 * SEER_exist^2) + (1.12 * SEER_exist)$

If SEER or EER rating unavailable use:

Cooling System	EER ⁵⁶⁶
Air Source Heat Pump	8.55
Central AC	8.15

CF

= Summer System Peak Coincidence Factor for Cooling

= 34%⁵⁶⁷

For example, an advanced thermostat replacing a programmable thermostat directly installed in a single zoned air source heat pump heated, single-family home in Mason City with advanced thermostat-controlled air conditioning of a system of unknown size and seasonal efficiency rating:

 $\Delta kW = (8\% * 36,000 * (1/8.15))/1000 * 100\% * 34\%$

= 0.1201 kW

NATURAL GAS ENERGY SAVINGS

 $\Delta Therms = \% FossilHeat * Gas_Heating_Consumption * \% Controlled * Heating_Reduction * HF \\ * Eff_ISR$

Where:

%FossilHeat

= Percentage of heating savings assumed to be Natural Gas

Heating fuel	%FossilHeat
Electric	0%
Natural Gas	100%
Unknown	94% ⁵⁶⁸

⁵⁶⁵ From Wassmer, M. (2003). A Component-Based Model for Residential Air Conditioner and Heat Pump Energy Calculations. Master's Thesis, University of Colorado at Boulder.

⁵⁶⁶ Average nameplate efficiencies of all Early Replacement qualifying equipment in Ameren, Illinois PY3-PY4 program data.
⁵⁶⁷ In the absence of conclusive results from empirical studies on peak savings, we recommend a temporary assumption of 50% of the cooling coincidence factor acknowledging that while the savings from the advanced Thermostat will track with the cooling load, the impact during peak periods may be lower. This is an assumption that could use future evaluation to improve these estimates.

⁵⁶⁸ Average (default) value of 94% gas space heating from 2009 Residential Energy Consumption Survey for Iowa. If utilities have specific evaluation results providing a more appropriate assumption for homes in a particular market or geographical area, then they should be used.

Iowa Energy Efficiency Statewide Technical Reference Manual -2.4.18 Advanced Thermostats

Gas_Heating_Consumption

= Estimate of annual household heating consumption for gas heated single-family homes. If location is unknown, assume 562 therms.⁵⁶⁹

		Gas_Heating_Consumption (Therms) by Climate Zone (City based upon)		
Heating System	Building Type	Zone 5 (Burlington) Zone 5 (Mason City)		
Heat Central	Manufactured	467	664	525
Furnace	Multifamily	310	440	348
Furnace	Single-family	537	763	603
Heat Central Boiler	Manufactured	598	850	672
	Multifamily	481	684	541
	Single-family	665	945	747

Other variables as provided above

For example, an advanced thermostat replacing a programmable thermostat directly-installed in a single zoned gas heated furnace single-family home in unknown location:

ΔTherms = 1.0 * 603 * 5.6% * 100% * 100% = 33.77 therms

PEAK GAS SAVINGS

 $\Delta PeakTherms = \Delta Therms * GCF$

Where:

ΔTherms	= Therm impact calculated above
GCF	= Gas Coincidence Factor for Heating ⁵⁷⁰
	= 0.014378 for Residential Boiler
	= 0.016525 for Residential Space Heating (other)

For example, an advanced thermostat replacing a programmable thermostat directly-installed in a single zoned gas heated furnace single-family home in unknown location:

ΔPeak Therms = 33.77 * 0.016525 = 0.558 therms

WATER IMPACT DESCRIPTIONS AND CALCULATION

N/A

⁵⁶⁹ Assumption that 93.4% of gas heated homes have furnaces and 6.6% have boilers, based on Dunsky and Opinion Dynamics Baseline Study results. Assume 80% Single Family and 20% Multifamily, based on 2009 Residential Energy Consumption Survey for Iowa, see "HC2.9 Structural and Geographic in Midwest Region.xls".

⁵⁷⁰ Calculated using Cadmus provided Gas Loadshapes as the maximum daily load for the end use.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.4.18 Advanced Thermostats

SUNSET DATE: 1/1/2022

Iowa Energy Efficiency Statewide Technical Reference Manual -2.4.19 Duct Insulation

2.4.19 Duct Insulation

DESCRIPTION

Energy and demand saving are realized through reductions in the home cooling and heating loads by insulating ductwork in unconditioned areas (e.g., attic with floor insulation, vented crawlspace, unheated garages. Basements should be considered conditioned space). If sealing of ducts is unknown, the sealed efficiency should be used.

This measure was developed to be applicable to the following program types: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient condition is ductwork in unconditioned areas that has been insulated.

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is the existing uninsulated or poorly insulated ductwork in unconditioned areas.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 20 years.⁵⁷¹

DEEMED MEASURE COST

The actual duct insulation measure cost should be used.

LOADSHAPE

Loadshape RE07 – Residential Single Family Cooling

Loadshape RE06 – Residential Single Family Central Heat

Loadshape RE08 – Residential Single Family Heat Pump

Algorithm

CALCULATION OF ENERGY SAVINGS

Savings should only be claimed for ductwork that exists on the exterior of the home or in uninsulated spaces.

ELECTRIC ENERGY SAVINGS

Electric energy savings is calculated as the sum of energy saved when cooling the home and energy saved when heating the building

$$\Delta kWh = \Delta kWh_{cooling} + \Delta kWh_{heating}$$

If central cooling, the electric energy saved in annual cooling due to the added insulation is

$$\Delta kWh_{cooling} = \frac{\left(\frac{1}{R_{existing}} - \frac{1}{R_{new}}\right) * Area * EFLH_{cooling} * \Delta T_{AVG, cooling}}{(1,000 * \eta_{cooling})}$$

Where:

⁵⁷¹ Consistent with duct insulation measure life specified in the MidAmerican Energy Company Joint Assessment, February 2013.

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.4.19 Duct Insulation

Rexisting	= Duct heat loss coefficient of existing duct [(hr- ^o F-ft ²)/Btu]
	= Estimate of actual with minimum of 1.0 for uninsulated duct ⁵⁷²
Rnew	= Duct heat loss coefficient with new insulation [(hr- ^o F-ft ²)/Btu]
	= Actual
Area	= Area of the duct surface exposed to the unconditioned space that has been insulated [ft ²]. (e.g., for circular duct – Calculate the circumference of the duct (= π * diameter) multiplied by length (ft))
$EFLH_{cooling}$	= Equivalent Full Load Cooling Hours

= Dependent on location:573

Climate Zene (City based upon)				
Climate Zone (City based upon)	Single Family	Multifamily	Manufactured

1,000

= Conversion from Btu to kBtu

 η_{cooling}

= Seasonal energy efficiency ratio (SEER) of cooling system (kBtu/kWh)

= Actual – If not available, use:⁵⁷⁶

Equipment Type	Age of Equipment	SEER Estimate of Sealed Duct	SEER Estimate of Unsealed Duct (SEER*0.85)
Central AC	Before 2006	10	8.5
Central AC	After 2006	13	11.05
Heat Pump	Before 2006	10	8.5

⁵⁷² Based upon findings in ACEEE study of internal film resistance: L. Palmiter and E Kruse, Ecotope Inc, "True R-Values of Round Residential Ductwork".

⁵⁷⁵ National Solar Radiation Data Base -- 1991- 2005 Update: Typical Meteorological Year 3

⁵⁷³ Full load hours for Des Moines are provided based on Cadmus modeling for the 2011 Joint Assessment. The other locations were calculated based on relative Cooling Degree Day ratios (from NCDC).

⁵⁷⁴ Leaving coil air temperatures are typically about 55°F. 60°F is used as an average temperature, recognizing that some heat transfer occurs between the ductwork and the environment it passes through.

http://rredc.nrel.gov/solar/old_data/nsrdb/1991-2005/tmy3/by_state_and_city.html . Heating Season defined as September 17th through April 13th, cooling season defined as May 20 through August 15th. For cooling season, temperatures from 8AM to 8PM were used to establish average temperatures as this is when cooling systems are expected to be loaded.

⁵⁷⁶ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Central AC was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time mean that using the minimum standard is appropriate.

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.4.19 Duct Insulation

Equipment Type	Age of Equipment	SEER Estimate of Sealed Duct	SEER Estimate of Unsealed Duct (SEER*0.85)
	2006-2014	13	11.05
	2015 on	14	11.9

For example, a single family house in Burlington with Central Air SEER = 13 and 10 ft. of uninsulated standard 6-inch round sealed duct in an unconditioned space.

$$\Delta kWh_{cooling} = ((1/1.0 - 1/(1.0 + 6)) * (\pi *0.5 * 10) * 918 * 20.4) / (1000 * 13)$$

= 19.4 kWh

If the home is heated with electric heat (resistance or heat pump), the electric energy saved in annual heating due to the added insulation is:

$$\Delta kWh_{heating} = \frac{\left(\frac{1}{R_{existing}} - \frac{1}{R_{new}}\right) * Area * EFLH_{heating} * \Delta T_{AVG,heating}}{(3,412 * \eta_{heating})}$$

Where:

EFLHheating

= Equivalent Full Load Heating Hours for ASHP

= Dependent on location:577

Zone 6 (Mason City)	2874	2335	3037	
Average/Unknown	2272	1846	2401	

ΔT_{AVG,heating} = Average temperature difference [^oF] during heating season between outdoor air temperature and assumed 115^oF duct supply temperature⁵⁷⁸

Climate Zone (City based upon)	OA _{AVG,heating} [°F] ⁵⁷⁹	ΔT _{AVG,heating} [°F]
Zone 5 (Burlington)	39.6	75.4
Zone 6 (Mason City)	35.9	79.1
Average/Unknown	30.1	84.9

3,142 = Conversion from Btu to kWh.

η_{heating} = Efficiency of heating system

⁵⁷⁷ Full load hours for Des Moines are provided based on Cadmus modeling for the 2011 Joint Assessment. The other locations were calculated based on relative Heating Degree Day ratios (from NCDC).

⁵⁷⁸ Forced air supply temperatures are typically 130°F. 115°F is used as an average temperature, recognizing that some heat transfer occurs between the ductwork and the environment it passes through.

⁵⁷⁹ National Solar Radiation Data Base -- 1991- 2005 Update: Typical Meteorological Year 3

http://rredc.nrel.gov/solar/old_data/nsrdb/1991-2005/tmy3/by_state_and_city.html . Heating Season defined as September 17th through April 13th, cooling season defined as May 20 through August 15th. For cooling season, temperatures from 8AM to 8PM were used to establish average temperatures as this is when cooling systems are expected to be loaded.

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.4.19 Duct Insulation

= Actual – If not available, use:⁵⁸⁰

System Type	Age of Equipment	HSPF Estimate	nHeat (Effective COP Estimate) of Sealed Ducts (HSPF/3.412)	ηHeat (Effective COP Estimate) of Unsealed Ducts (HSPF/3.412)*0.85
	Before 2006	6.8	1.99	1.69
Heat Pump	2006 – 2014	7.7	2.26	1.92
	2015 on	8.2	2.40	2.04

For example, a single family house in Burlington with a Heat Pump COP = 1.92 and 10 ft. of uninsulated standard 6-inch round sealed duct in an unconditioned space. $\Delta kWh_{heating} = ((1/1.0 - 1/(1.0 + 6)) * (\pi * 0.5 * 10) * 2022 * 75.4) / (3412 * 2.0)$ = 300.8 kWh

If the home is heated with a gas furnace, there will be some electric savings in heating the building attributed to extra insulation since the furnace fans will run less.

$$\Delta kWh_{heating} = \Delta Therms * Fe * 29.3$$

Where:

ΔTherms	= Gas savings calculated with equation below.
Fe	= Percentage of heating energy consumed by fans, assume 3.14% ⁵⁸¹
29.3	= Conversion from therms to kWh

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \frac{\Delta kWh cooling}{EFLH cooling} * CF$$

Where:

 $\mathsf{EFLH}_{\mathsf{cooling}}$

= Equivalent Full Load Cooling Hours

= Dependent on location:⁵⁸²

Climate Zone (City based upon)	EFLH _{cooling}			
Climate Zone (City based upon)	Single Family	Multifamily	Manufactured	
Zone 5 (Burlington)	918	736	865	
Zone 6 (Mason City)	468	375	441	

⁵⁸⁰ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Heat Pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

⁵⁸¹ F_e is not one of the AHRI certified ratings provided for furnaces, but can be reasonably estimated from a calculation based on the certified values for fuel energy (Ef in MMBtu/yr) and Eae (kWh/yr). An average of a 300 record sample (non-random) out of 1495 was 3.14% for residential units. This is, appropriately, ~50% greater than the Energy Star version 3 criteria for 2% F_e. See "Programmable Thermostats Furnace Fan Analysis.xlsx" for reference. Assumed to be consistent with C&I applications. ⁵⁸² Full load hours for Des Moines are provided based on Cadmus modeling for the 2011 Joint Assessment. The other locations were calculated based on relative Cooling Degree Day ratios (from NCDC).

Iowa Energy Efficiency Statewide Technical Reference Manual -2.4.19 Duct Insulation

Climate Zone (City based upon)	EFLHcooling			
Climate zone (City based upon)	Single Family	Multifamily	Manufactured	
Average/Unknown	811	650	764	

CF = Summer System Peak Coincidence Factor for Cooling

= 68% if central AC, 72% if ducted ASHP⁵⁸³

For example, using the above for a single family house in Burlington with Central Air SEER = 13 and 10 ft. of uninsulated standard 6-inch round sealed duct in an unconditioned space.

ΔkW = 19.4 / 918 * 0.68 = 0.0144 kW

NATURAL GAS SAVINGS

If homes with a gas heating system, the savings resulting from the insulation is calculated with the following formula.

$$\Delta \text{Therms} = \frac{\left(\frac{1}{R_{existing}} - \frac{1}{R_{new}}\right) * Area * EFLH_{gasheat} * \Delta T_{AVG,heating}}{(100,000 * \eta_{heat})}$$

Where:

Rexisting	= Duct heat loss coefficient with existing insulation
	[(hr- ^o F-ft ²)/Btu]
R _{new}	= Duct heat loss coefficient with new insulation [(hr- ^o F-ft ²)/Btu]
Area	= Area of the duct surface exposed to the unconditioned space that has been insulated [ft ²].
$EFLH_{gasheat}$	= Equivalent Full load heating hours for Furnaces (see above)
	= Dependent on location: ⁵⁸⁴

	EFLH (Hours)					
Climate Zone (City based upon)	Single Family New	Single Family Existing	Multifamily New	Multifamily Existing	Manufactured New	Manufactured Existing
Zone 5 (Burlington)	915	1054	638	896	777	1079
Zone 6 (Mason City)	1302	1496	906	1272	1106	1533
Average/ unknown	1028	1183	718	1005	874	1212

 $\Delta T_{AVG,heating}$ = Average temperature difference [°F] during heating season (see above)

100,000

= Conversion from BTUs to Therms

⁵⁸³ Based on analysis of metering results from homes in Ameren Illinois service territory in PY5; 'Impact and Process Evaluation of Ameren Illinois Company's Residential HVAC Program (PY5)'.

⁵⁸⁴ To calculate the EFLH for an average home as opposed to one with a high efficiency that has been installed using HVAC SAVE, the EFLH developed by TetraTech (see Furnace measure for reference) are adjusted to account for a lower AFUE (85% v 95%) and to derate the AFUE by the factor used for a non-QI furnace. See 'Adjusting EFLH for 'average' home'.xls for more information.

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.4.19 Duct Insulation

η_{heat}	= Efficiency of gas heating system
	= Actual ⁵⁸⁵ – If not available, use 87% for sealed ducts ⁵⁸⁶ or 74% for unsealed ducts ⁵⁸⁷
or example,	a single family house in Burlington with a gas heating system COP = 0.87 and 10 ft. of uninsulated

For example, a single family house in Burlington with a gas heating system COP = 0.87 and 10 ft. of uninsulated standard 6-inch round sealed ducts in an unconditioned space. $\Delta Therms = ((1/1.0 - 1/(1.0 + 6)) * (\pi * 0.5 * 10) * 1054 * 75.4) / (100,000 * 0.87)$

= 12.3 Therms

PEAK GAS SAVINGS

 $\Delta PeakTherms = \Delta Therms * GCF$

Where:

ΔTherms	= Therm impact calculated above
GCF	= Gas Coincidence Factor for Heating ⁵⁸⁸
	= 0.016525 for Residential Space Heating (other)

For example, using the above, a single family house in Burlington with a gas heating system COP = 0.87 and 10 ft. of uninsulated standard 6-inch round sealed ducts in an unconditioned space.

ΔPeakTherms = 12.3 * 0.016525 = 0.203 Therms

WATER IMPACT DESCRIPTIONS AND CALCULATION

N/A

DEEMED O&M COST ADJUSTMENT CALCULATION

N/A

MEASURE CODE: RS-HVC-DUCT-V03-200101

SUNSET DATE: 1/1/2022

⁵⁸⁵ The Equipment Efficiency can be obtained either by recording the AFUE of the unit, or performing a steady state efficiency test. If there is more than one heating system, the weighted (by consumption) average efficiency should be used. If the heating system or distribution is being upgraded within a package of measures together with the insulation upgrade, the new average heating system efficiency should be used.

 $^{^{586}}$ In 2000, 60% of furnaces purchased in Iowa were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the state. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: (0.60*0.92) + (0.40*0.8) = 0.872.

⁵⁸⁷ An 85% distribution efficiency is then applied to account for duct losses for furnaces.

⁵⁸⁸ Calculated using Cadmus provided Gas Loadshapes as the maximum daily load for the end use.

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.4.20 Advanced Thermostat Optimization Services

2.4.20 Advanced Thermostat Optimization Services

DESCRIPTION

This measure provides the characterization of additional savings to the Advanced Thermostat measure which are achieved for participants that enroll in a program that provides additional optimization of the Advanced Thermostat control strategy. This software add on deploys a set point altering algorithm to generate additional heating and cooling savings than would be realized from just the advanced thermostat alone.

This measure was developed to be applicable to the following program types: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient case is a participant that has enrolled on the Advanced Thermostat Optimization Service program.

DEFINITION OF BASELINE EQUIPMENT

The baseline is an advanced thermostat that has not enrolled on the Advanced Thermostat Optimization Service program.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life for savings associated with the program is 1 year.⁵⁸⁹

DEEMED MEASURE COST

The measure cost is the cost to enroll in the program and should be based on actual costs. For planning purposes a cost of \$6.00 per participant for a single year can be used based on proposals provided for other utility programs.

LOADSHAPE

∆kWh	ightarrow RE08 – Residential Single Family Heat Pump
$\Delta kWh_{heating}$	→ RE06 – Residential Single Family Central Heat
	ightarrow RE01 – Residential Multifamily Central Heat
$\Delta kWh_{cooling}$	→ RE07 – Residential Single Family Cooling
	→ RE02 – Residential Multifamily Cooling
∆Therms	→ RG02 – Residential Boiler
	→ RG04 – Residential Other Heating

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

ΔkWh	$= \Delta kWh_{HeatingOptimized} + kWh_{CoolingOptimized}$
$\Delta kWh_{HeatingOptimized}$	$= NewHeatingConsumption * Heating_{OptimizedReduction}$
$\Delta kWh_{CoolingOptimized}$	= NewCoolingConsumption * Cooling _{OptimizedReduction}

Where:

NewCoolingConsumption = New cooling consumption – i.e. calculation of consumption after subtracting

⁵⁸⁹ The annual savings characterized are achieved during any year the participant is enrolled.

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.4.20 Advanced Thermostat Optimization Services

	the base level savings from the Advanced Thermostat measure.
Cooling _{OptimizedReduction}	 Assumed percentage reduction in household cooling energy consumption due to Nest Seasonal Savings.
	= 2.2% ⁵⁹⁰
NewHeatingConsumption	= New heating consumption – i.e., calculation of consumption after subtracting the base level savings from the Advanced Thermostat measure
$Heating_{OptimizedReduction}$	= Assumed percentage reduction in household heating energy consumption due to Nest Seasonal Savings.
	= 3.5% ⁵⁹¹

For example, an advanced thermostat enrolled in the Advanced Thermostat Optimization program in a single zone air source heat pump heated, single-family home in Mason City with advanced thermostat-controlled air conditioning of a system of unknown size and seasonal efficiency rating:

 $\Delta kWH = \Delta kWh_{HeatingOptimized} + \Delta kWh_{CoolingOptimized}$ = (14,778 - 828) * 3.5% + (1296 - 104) * 2.2% = 488.25 + 26.22 = 514 kWh

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \frac{\Delta kW h_{CoolingSeasonal}}{EFLH_{Cool}}$$

Where:

EFLH_{Cool}

= Equivalent Full Load Hours of air conditioning

= Dependent on loction⁵⁹²

Climate Zone	EFLH _{cool} (Hours)					
(City based upon)	Single Family	Single Family	Multifamily	Multifamily	Manufactured	Manufactured
(City based upon)	New	Existing	New	Existing	New	Existing
Zone 5 (Burlington)	548	918	504	736	508	865
Zone 6 (Mason City)	279	468	257	375	259	441
Average/ unknown	484	811	445	650	449	764

⁵⁹⁰ Reduction of 2.2% based on evaluation of DCSEU program: NMR, March 2019, "Nest Seasonal Savings Evaluation".

⁵⁹¹ 3.5% based on findings from a deployment with over 20,000 units in Massachusetts (Page 2, Request for Approval of MCE Seasonal Savings Pilot Program, MCE, August 18, 2016. MCE-AL-17-E-Seasonal-Savings-Pilot.pdf). The savings determined through this evaluation represents the average savings from all participants, including those that pull out or override the program.

⁵⁹² Full load hours for Des Moines are provided based on Cadmus modeling for the 2011 Joint Assessment. The other locations were calculated based on relative Cooling Degree Day ratios (from National Climatic Data Center, NCDC).

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.4.20 Advanced Thermostat Optimization Services

For example, an advanced thermostat enrolled in the Seasonal Savings program in a single zoned air source heat pump heated, single-family home in Mason City with advanced thermostat-controlled air conditioning of a system of unknown size and seasonal efficiency rating:

 $\Delta kW = 26.22 / 918$ = 0.0286 kW

NATURAL GAS ENERGY SAVINGS

 $\Delta Therms = NewGastHeatingConsumption * Heating_{OptimizedReduction}$

Where:

NewGasHeatingConsumption	= New heating consumption – i.e., calculation of consumption after
	subtracting the base level savings from the Advanced Thermostat
	measure

Other variables as provided above

For example, an advanced thermostat enrolled in the Advanced Thermostat Optimization program in a single zoned gas heated furnace single-family home in unknown location: Δ Therms = (603-33.77) * 3.5% = 19.92 Therms

- 19.92 1110

PEAK GAS SAVINGS

 $\Delta PeakTherms = \Delta Therms * GCF$

Where:

ΔTherms	= Therm impact calculated above
GCF	= Gas Coincidence Factor for Heating ⁵⁹³
	= 0.014378 for Residential Boiler
	= 0.016525 for Residential Space Heating (other)

For example, an advanced thermostat enrolled in the Advanced Thermostat Optimization program in a single zoned gas heated furnace single-family home in unknown location:

ΔPeakTherms = 19.92 * 0.016525 = 0.3292 Therms

⁵⁹³ Calculated using Cadmus provided Gas Loadshapes as the maximum daily load for the end use.

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.5.1 Compact Fluorescent Lamp - Standard

2.5 Lighting

2.5.1 Compact Fluorescent Lamp – Standard

NOTE: THIS MEASURE IS EFFECTIVE UNTIL 12/31/2017. IT SHOULD NOT BE USED BEYOND THAT DATE BUT IS LEFT IN THE MANUAL FOR REFERENCE PURPOSES.

DESCRIPTION

A low wattage ENERGY STAR qualified compact fluorescent screw-in bulb (CFL) is installed in place of a baseline screw-in bulb.

This characterization provides assumptions for when the CFL is installed in a known location (i.e., residential and inunit interior or exterior) or, if the implementation strategy does not allow for the installation location to be known (e.g., an upstream retail program or efficiency kit), an unknown residential location assumption is provided. For upstream programs, utilities should develop an assumption of the Residential v Nonresidential split and apply the relevant assumptions to each portion.

Federal legislation stemming from the Energy Independence and Security Act of 2007 (EISA) requires all generalpurpose light bulbs between 40W and 100W to be approximately 30% more energy efficient than standard incandescent bulbs. Production of 100W, standard efficacy incandescent lamps ended in 2012, followed by restrictions on 75W lamps in 2013 and 60W and 40W lamps in 2014. The baseline for this measure has therefore become bulbs (improved incandescent or halogen) that meet the new standard. Furthermore, the Technical Advisory Committee approved assuming a blended baseline condition of EISA qualified incandescent/halogen, CFL and LED lamps. This assumption should be reviewed during each update cycle and when the net to gross impacts for this measure are determined.

A provision in the EISA regulations requires that by January 1, 2020, all lamps meet efficiency criteria of at least 45 lumens per watt, in essence making the baseline equivalent to a current day CFL. Therefore, the measure life (number of years that savings should be claimed) should be reduced once the assumed lifetime of the bulb exceeds 2020.

This measure was developed to be applicable to the following program types: TOS, NC, DI, KITS.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, the high-efficiency equipment must be a standard general service ENERGY STAR qualified compact fluorescent lamp based upon the v1.1 ENERGY STAR specification for lamps (<u>https://www.energystar.gov/sites/default/files/ENERGY%20STAR%20Lamps%20V1%201_Specification.pdf</u>. Note a new ENERGY STAR specification v2.0 will become effective on 1/2/2017 (<u>https://www.energystar.gov/sites/default/files/asset/document/ENERGY%20STAR%20Lamps%20V2%20Revised%</u> 20Spec.pdf).

DEFINITION OF BASELINE EQUIPMENT

The baseline condition for this measure is assumed to be a blend of 70% EISA qualified halogen or incandescent and 20% CFL and 5% LED.⁵⁹⁴

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

For Residential, Multifamily In-unit bulbs, and Unknown: The expected lifetime of a CFL is assumed to be 5.2 years.⁵⁹⁵

⁵⁹⁴ As proposed and discussed by Iowa TRM Oversight Committee and Technical Advisory Committee.

⁵⁹⁵ Jump et al. 2008: "Welcome to the Dark Side: The Effect of Switching on CFL Measure Life" indicates that the "observed life"

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.5.1 Compact Fluorescent Lamp - Standard

To account for the backstop provision of the EISA 2007 legislation, for bulbs installed in 2015 this would be reduced to 5 years, and then for every subsequent year should be reduced by one year.⁵⁹⁶

Exterior bulbs: The expected measure life is 4.0 years⁵⁹⁷ for bulbs up to 2016. For bulbs installed in 2017 this would be reduced to 3 years, etc.

DEEMED MEASURE COST

For the Retail (Time of Sale) measure, the incremental capital cost for all bulbs under 2,000 lumens is \$1.03⁵⁹⁸ (baseline cost of \$2.17⁵⁹⁹ and efficient cost of \$3.20).

For bulbs over 2,000 lumens, the assumed incremental capital cost is \$2.76⁶⁰⁰ (baseline cost of \$3.44⁶⁰¹ and efficient cost of \$6.20).

For the Direct Install measure, actual program delivery costs should be used if available. If not, the full cost of 3.20^{602} per bulb <2000 lumens or 6.20 per bulb ≥ 2000 lumens should be used, plus 10 labor^{603} , for a total measure cost of 13.20 per < 2,000 lumen bulb and 16.20 per ≥ 2,000 lumen bulb.

For bulbs provided in Efficiency Kits, the actual program delivery costs should be used.

Loadshape RE10 – Residential Outdoor Lighting

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

$$\Delta kWh = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * (WHFeHeat + (WHFeCool - 1))$$

Where:

```
Watts<sub>Base</sub>
```

= Based on lumens of CFL bulb installed and includes blend of incandescent/halogen⁶⁰⁴,

of CFLs with an average rated life of 8000 hours (8000 hours is the average rated life of ENERGY STAR bulbs (<u>http://www.energystar.gov/index.cfm?c=cfls.pr_crit_cfls</u>) is 5.2 years.

⁵⁹⁶ Since the replacement baseline bulb from 2020 on will be equivalent to a CFL, no additional savings should be claimed from that point forward.

⁵⁹⁷ Based on using 10,000 hour rated life, minimum ENERGY STAR v1.1 requirement. 10,000/2475 = 4.0 years

⁵⁹⁸ Incandescent/halogen and CFL assumptions based on incremental costs for 60W equivalent (dominant bulb) from "2010-2012 WA017 Ex Ante Measure Cost Study Draft Report", Itron, February 28, 2014.

⁵⁹⁹ Based on 70% Incandescent (\$1.40), 25% CFL (\$3.20) and 5% LED (\$7.87). LED lamp costs are based on a 2014/2015 VEIC review of a year's worth of LED sales through VEIC implemented programs. The retail cost was averaged and then DOE price projection trends (from Department of Energy, 2012; "Energy Savings Potential of Solid-State Lighting in General Illumination Applications", Table A.1) used to decrease the cost for a 2017 TRM assumption (see 2015 LED Sales Review.xls). LED costs are falling rapidly and should be reviewed in each update cycle.

⁶⁰⁰ Based on high brightness lamps from "2010-2012 WA017 Ex Ante Measure Cost Study Draft Report", Itron, February 28, 2014.

⁶⁰¹ Based on 70% Incandescent (\$1.60), 25% CFL (\$6.20) and 5% LED (\$15.39)

⁶⁰² Based on 15W CFL, "2010-2012 WA017 Ex Ante Measure Cost Study Draft Report", Itron, February 28, 2014.

⁶⁰³ Assumption based on 15 minutes (including portion of travel time) and \$40 per hour.

⁶⁰⁴ Incandescent/Halogen wattage is based upon the post first phase of EISA wattage and wattage bins consistent with ENERGY STAR, v1.1; <u>http://www.energystar.gov/sites/default/files/ENERGY%20STAR%20Lamps%20V1%201</u> Specification.pdf.

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.5.1 Compact Fluorescent Lamp – Standard

CFL and LED by weightings provided in table below⁶⁰⁵. Note that when an IA net-to-gross (NTG) factor is determined for this measure, this blended baseline should be replaced with the Incandescent/Halogen baseline only.

Watts_{EE} = Actual wattage of CFL purchased / installed – If unknown, assume the following defaults⁶⁰⁶:

Lower Lumen	Upper Lumen	Inc/Halogen	Watts _{EE} CFL	LED	Watts _{Base}	Delta Watts
Range	Range	70%	25%	5%		vvalls
250	309	25	5.1	4.0	19.0	13.9
310	749	29	9.4	6.7	23.0	13.6
750	1,049	43	13.4	10.1	33.9	20.6
1,050	1,489	53	18.9	12.8	42.5	23.5
1,490	2,600	72	24.8	17.4	57.5	32.7
2,601	3,000	150	41.1	43.1	117.4	76.3
3,001	3,999	200	53.8	53.8	156.2	102.3
4,000	6,000	300	65.0	76.9	230.1	165.1

ISR

= In Service Rate, the percentage of units rebated that are actually in service

Program		# of bulbs	Discounted In Service Rate (ISR) ⁶⁰⁷
	Retail (Time of Sale) ⁶	08	92%
	Direct Install ⁶⁰⁹		97%
Efficiency Kits	School Kits ⁶¹⁰	1	57%
		2	48%
		3	42%
		Unknown ⁶¹¹	49%
	EnergyWise (Low Income) ⁶¹²	1	79%
		2	74%
		Unknown ⁶¹³	76.5%

⁶⁰⁵ Weightings were determined through discussions with the Technical Advisory Committee. These are based upon review of Itron socket saturation and inventory data, in addition to review of multiple other data sources on the lighting market in other jurisdictions.

⁶⁰⁶ Watts_{EE} defaults are based upon the average available ENERGY STAR product, accessed 06/18/2015. For any lumen range where there is no ENERGY STAR product currently available, Watts_{EE} is based upon the ENERGY STAR minimum luminous efficacy (55Lm/W for lamps with rated wattages less than 15W and 65 Lm/W for lamps with rated wattages \geq 15 watts) for the mid-point of the lumen range. See calculation at "cerified-light-bulbs-2015-06-18.xlsx". These assumptions should be reviewed regularly to ensure they represent the available product.

⁶⁰⁷ All Programs except for Direct Install assume that some lamps are not installed in the first year but are later installed in years 2 and 3. To ease implementation, these future installs are discounted using the statewide real discount rate (7.71%); see "Res Lighting ISR calculation.xlsx" for more information.

⁶⁰⁸ In service rate for Retail CFLs is based upon recommendation in the Uniform Methods Project to use data from the Navigant Consulting and Apex Analytics (2013) study.

⁶⁰⁹ Based upon review of the Illinois PY2 and PY3 ComEd Direct Install program surveys; <u>http://www.ilsag.info/evaluation-documents.html</u>

⁶¹⁰ Based on results provided in "School-based interim process memo_Final_100215.doc".

⁶¹¹ Average of above.

⁶¹² Based on Cadmus, "Final Report: Iowa 2015 Energy Wise Program", January 29, 2016, p16.

⁶¹³ Average of above.

Iowa Energy Efficiency Statewide Technical Reference Manual -2.5.1 Compact Fluorescent Lamp - Standard

Hours

= Average hours of use per year

Installation Location	Hours
Residential Interior and in-unit Multifamily	894 ⁶¹⁴
Exterior	2,475 ⁶¹⁵
Unknown (e.g., Retail, Upstream, and Efficiency Kits)	973 ⁶¹⁶

WHFe_{Heat} = Waste Heat Factor for energy to account for electric heating increase from reducing waste heat from efficient lighting (if fossil fuel heating – see calculation of heating penalty in that section)

= 1 - ((HF / ηHeat_{Electric}) * %ElecHeat)

If unknown assume 0.94⁶¹⁷

Where:

- HF = Heating Factor or percentage of light savings that must now be heated
 - = 53%⁶¹⁸ for interior or unknown location
 - = 0% for exterior or unheated location
- ηHeat_{Electric} = Efficiency in COP of Heating equipment
 - = Actual If not available, use⁶¹⁹:

System Type	Age of Equipment	HSPF Estimate	ηHeat (COP Estimate)
	Before 2006	6.8	2.00
Heat Pump	2006-2014	7.7	2.26
	2015 and after	8.2	2.40
Resistance	N/A	N/A	1.00
Unknown	N/A	N/A	1.38 ⁶²⁰

%ElecHeat

= Percentage of home with electric heat

Heating fuel	%ElecHeat
Electric	100%

 ⁶¹⁴ Average of four Midwest metering studies: 2011 Ameren Missouri Lighting and Appliance Evaluation – PY 2; 2012 Consumers Energy - Technical Memo; 2012 DTE - Technical Memo; and PY5/PY6 ComEd, Illinois Residential Lighting Program evaluation.
 ⁶¹⁵ Based on secondary research conducted as part of the Illinois PY5/PY6 ComEd Residential Lighting Program evaluation.
 ⁶¹⁶ Assumes E% outprior lighting hazed on Illinois DY5/PY6 ComEd Residential Lighting Program evaluation.

⁶¹⁶ Assumes 5% exterior lighting, based on Illinois PY5/PY6 ComEd Residential Lighting Program evaluation.

⁶¹⁷ Calculated using defaults: 1-((0.53/1.38) * 0.15) = 0.94

⁶¹⁸ This means that heating loads increase by 53% of the lighting savings. This is based on the average result from REMRate modeling of several different building configurations in Des Moines, Mason City, and Burlington.

⁶¹⁹ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 and 2015 the Federal Standard for Heat Pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time mean that using the minimum standard is appropriate.

⁶²⁰ Calculation assumes 33% Heat Pump and 67% Resistance, which is based upon data from Energy Information Administration, 2009 Residential Energy Consumption Survey, see "HC6.9 Space Heating in Midwest Region.xls". Average efficiency of heat pump is based on assumption 50% are units from before 2006 and 50% 2006-2014.

Iowa Energy Efficiency Statewide Technical Reference Manual -2.5.1 Compact Fluorescent Lamp - Standard

Heating fuel	%ElecHeat
Fossil Fuel	0%
Unknown	15% ⁶²¹

WHFecool

= Waste Heat Factor for energy to account for cooling savings from reducing waste heat from efficient lighting

Bulb Location	WHFecool
Building with cooling	1.12 ⁶²²
Building without cooling or exterior	1.0
Unknown	1.08623

For example, for a 900 lumen 17W standard CFL in an unknown location: $\Delta kWh = ((33.9 - 17) / 1000) * 0.92 * 973 * (0.94 + (1.08 - 1))$ = 15.4 kWh

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * WHFdCool * CF$$

Where:

WHFdCool

= Waste Heat Factor for demand to account for cooling savings from efficient lighting

Bulb Location	WHFdCool
Building with cooling	1.22 ⁶²⁴
Building without cooling or exterior	1.0
Unknown (e.g., Retail, Upstream, and Efficiency Kits)	1.14 ⁶²⁵

CF

= Summer peak Coincidence Factor for measure

Bulb Locatio	CF			
Residential	Interior	and	in-unit	13.1%
Multifamily	626			15.1%

⁶²¹ Based on data from Energy Information Administration, 2009 Residential Energy Consumption Survey, see "HC6.9 Space Heating in Midwest Region.xls".

 625 The value is estimated at 1.14 (calculated as 1 + (0.64 * 0.61 / 2.8)).

⁶²² The value is estimated at 1.12 (calculated as 1 + (0.34 / 2.8)). Based on cooling loads decreasing by 34% of the lighting savings (average result from REMRate modeling of several different building configurations in Des Moines, Mason City, and Burlington), assuming typical cooling system operating efficiency of 2.8 COP (starting from standard assumption of SEER 10.5 central AC unit, converted to 9.5 EER using algorithm (-0.02 * SEER²) + (1.12 * SEER) (from Wassmer, M. (2003); A Component-Based Model for Residential Air Conditioner and Heat Pump Energy Calculations. Master's Thesis, University of Colorado at Boulder), converted to COP = EER/3.412 = 2.8COP).

⁶²³ The value is estimated at 1.09 (calculated as 1 + (0.64*(0.34 / 2.8))). Based on assumption that 64% of homes have central cooling (based on 2009 Residential Energy Consumption Survey, see "HC7.9 Air Conditioning in Midwest Region.xls"). ⁶²⁴ The value is estimated at 1.22 (calculated as 1 + (0.61 / 2.8)). See footnote relating to WHFe for details. Note the 61% factor represents the Residential cooling coincidence factor calculated using the average load during the peak period (as opposed to the peak hour) consistent with the lighting peak hours.

⁶²⁶ Based on analysis of loadshape data provided by Cadmus.

Iowa Energy Efficiency Statewide Technical Reference Manual -2.5.1 Compact Fluorescent Lamp - Standard

Bulb Location	CF
Exterior 627	1.8%
Unknown (e.g., Retail, Upstream and Efficiency Kits) ⁶²⁸	12.5%

Other factors as defined above

For example, fo	For example, for a 900 lumen 17W standard CFL in an unknown location:				
ΔkW	= ((33.9 - 17) / 1000) * 0.92 * 1.14 * 0.125				
	= 0.0022 kW				

NATURAL GAS SAVINGS

Heating Penalty for Natural Gas heated homes⁶²⁹:

$$\Delta Therms = -\frac{\frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * HF * 0.03412}{\eta \text{Heat}} * \% \text{GasHeat}$$

Where:

HF	= Heating Factor or percentage of light savings that must now be heated							
	= 53% ⁶³⁰ for interior or unknown location							
	= 0% for exterior or unheated	= 0% for exterior or unheated location						
0.03412	= Converts kWh to Therms							
$\eta Heat_{Gas}$	= Efficiency of heating system	= Efficiency of heating system						
	= 74% ⁶³¹							
%GasHeat	= Percentage of homes with g	as heat						
	Heating fuel	%GasHeat]					
	Electric	0%						
	Gas 100%							
	Unknown	85% ⁶³²						

current mix of furnaces in the State. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.60*0.92) + (0.40*0.8)) * (1-0.15) = 0.74.

⁶²⁷ Based on Itron eShapes lighting loadprofiles.

⁶²⁸ Assumes 5% exterior lighting, based on PYPY5/PY6 ComEd Residential Lighting Program evaluation.

⁶²⁹ Results in a negative value because this is an increase in heating consumption due to the efficient lighting.

⁶³⁰ This means that heating loads increase by 53% of the lighting savings. This is based on the average result from REMRate modeling of several different building configurations in Des Moines, Mason City, and Burlington, IA.

⁶³¹ This has been estimated assuming that natural gas central furnace heating is typical for lowa residences (the predominant heating is gas furnace with 49% of lowa homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey)). In 2000, 60% of furnaces purchased in lowa were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the

⁶³² Based on data from Energy Information Administration, 2009 Residential Energy Consumption Survey, see "HC6.9 Space Heating in Midwest Region.xls".

Iowa Energy Efficiency Statewide Technical Reference Manual -2.5.1 Compact Fluorescent Lamp - Standard

For example, for a 900 lumen 17W standard CFL in an unknown location:						
ΔTherms	= - ((((33.9 - 17) / 1000) * 0.92 * 973 * 0.53 * 0.03412) / 0.74) * 0.85					
	= - 0.31 Therms					

PEAK GAS SAVINGS

For ease of application, savings for this measure is assumed to be evenly spread across the year. The Peak Gas Savings is therefore assumed to be:

 $\Delta PeakTherms = \frac{\Delta Therms}{HeatDays}$

Where:

ΔTherms	= Therm impact calculated above
HeatDays	= Heat season days per year
	= 217 ⁶³³

For example, for a 900 lumen 17W standard CFL in an unknown location: Δ PeakTherms = - 0.31 /217 = -0.0014 therms

WATER IMPACT DESCRIPTIONS AND CALCULATION

N/A

DEEMED O&M COST ADJUSTMENT CALCULATION

The O&M assumptions that should be used in cost effectiveness calculations are provided below:

Installation Location	Replacement Period (years) ⁶³⁴	Replacement Cost		
Residential Interior and in-unit Multifamily	4.7	ća 17 far bulka 22 000 lumana		
Exterior	1.7	\$2.17 for bulbs <2,000 lumens \$3.44 for bulbs ≥2,000 lumens		
Unknown (e.g., Retail, Upstream, and Efficiency Kits)	4.3	25.44 101 builds 22,000 lumens		

⁶³³ Number of days where HDD 60 >0.

⁶³⁴ Calculated by dividing assumed rated life of baseline bulb by hours of use. Assumed lifetime of EISA qualified Halogen/ Incandescents is 1000 hours. The manufacturers are simply using a regular incandescent lamp with halogen fill gas rather than Halogen Infrared to meet the standard (as provided by G. Arnold, NEEP and confirmed by N. Horowitz at NRDC). Assumed lifetime of CFL is 10,000 and of LED is 20,000 hours. Values provided are an average based on 70% incandescent/halogen, 25% CFL and 5% LED (blended average of 4200 hours).

⁶³⁵ Incandescen/halogen and CFL costs based on "2010-2012 WA017 Ex Ante Measure Cost Study Draft Report", Itron, February 28, 2014. LED lamp costs are based on a 2014/2015 VEIC review of a year's worth of LED sales through VEIC implemented programs. The retail cost was averaged and then DOE price projection trends (from Department of Energy, 2012; "Energy Savings Potential of Solid-State Lighting in General Illumination Applications", Table A.1) used to decrease the cost for a 2017 TRM assumption (see 2015 LED Sales Review.xls). LED costs are falling rapidly and should be reviewed in each update cycle. Baseline based on 70% Incandescent/halogen, 25% CFL and 5% LED.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.5.1 Compact Fluorescent Lamp – Standard

MEASURE CODE: RS-LTG-ESCF-V01-170101

SUNSET DATE: 1/1/2018

Iowa Energy Efficiency Statewide Technical Reference Manual—2.5.2 Compact Fluorescent Lamp – Specialty

2.5.2 Compact Fluorescent Lamp – Specialty

NOTE: THIS MEASURE IS EFFECTIVE UNTIL **12/31/2017**. IT SHOULD NOT BE USED BEYOND THAT DATE BUT IS LEFT IN THE MANUAL FOR REFERENCE PURPOSES.

DESCRIPTION

An ENERGY STAR qualified specialty compact fluorescent bulb is installed in place of an incandescent specialty bulb.

This characterization provides assumptions for when the CFL is installed in a known location (i.e., residential and inunit interior or exterior) or, if the implementation strategy does not allow for the installation location to be known (e.g., an upstream retail program or efficiency kit), an unknown residential location assumption is provided. For upstream programs, utilities should develop an assumption of the Residential vs Nonresidential split and apply the relevant assumptions to each portion.

The Technical Advisory Committee approved assuming a blended baseline condition of EISA qualified incandescent/halogen, CFL and LED lamps. This assumption should be reviewed during each update cycle and when the net to gross impacts for this measure are determined.

This measure was developed to be applicable to the following program types: TOS, NC, DI, KITS.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

ENERGY STAR qualified specialty CFL bulb based upon the v1.1 ENERGY STAR specification for lamps (<u>http://www.energystar.gov/sites/default/files/ENERGY%20STAR%20Lamps%20V1%201_Specification.pdf</u>). Note a new ENERGY STAR specification v2.0 will become effective on 1/2/2017 (<u>https://www.energystar.gov/sites/default/files/asset/document/ENERGY%20STAR%20Lamps%20V2%20Revised%</u>20Spec.pdf).

DEFINITION OF BASELINE EQUIPMENT

The baseline condition for this measure is assumed to be a blend of 80% EISA qualified halogen or incandescent and 10% CFL and 10% LED⁶³⁶. Lamp types include those exempt from the EISA 2007 standard: three-way, plant light, daylight bulb, bug light, post light, globes G40 (\leq 40W equivalent (We)), candelabra base (\leq 60We), vibration service bulb, decorative candle with medium or intermediate base (\leq 40We), shatter resistant, and reflector bulbs, and standard bulbs greater than 2601 lumens, and those non-exempt from EISA 2007: dimmable, globes (less than 5" diameter and >40We), candle (shapes B, BA, CA >40We), candelabra base lamps (>60We), and intermediate base lamps (>40We).

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be as follows:

Installation Location	Measure Life (years) ⁶³⁷
Residential Interior and in-unit Multifamily	11.2
Exterior	4.0
Unknown (e.g., Retail, Upstream and Efficiency Kits)	10.3

⁶³⁶ As proposed and discussed by Iowa TRM Oversight Committee and Technical Advisory Committee.

⁶³⁷ Based on dividing hours of use assumptions with rated life assumption of 10,000 hours as per ENERGY STAR v1.1 requirements.

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.5.2 Compact Fluorescent Lamp – Specialty

DEEMED MEASURE COST

Wherever possible, actual incremental costs should be used. If unavailable, assume the following incremental costs⁶³⁸:

Bulb Type	CFL Wattage	CFL	Incandescent	LED	Blended Baseline ⁶³⁹	Incremental Cost
Directional	< 20W	\$7.84	¢6.21	\$14.52	\$7.28	\$0.56
Directional	≥20W	\$9.31	\$6.31	\$45.85	\$10.56	-\$1.25
Decorative and	<15W	\$7.80	\$3.92	\$8.09	\$4.73	\$3.08
Globes	≥15W	\$8.15	ŞS.92	\$15.86	\$5.54	\$2.61

For other bulb types, or unknown, assume the incremental capital cost of \$1.81 (blended baseline cost of \$6.01 and efficient cost of \$7.82⁶⁴⁰).

For the Direct Install measure, the full CFL cost should be used plus \$10 labor⁶⁴¹. However, actual program delivery costs should be used if available.

For bulbs provided in Efficiency Kits, the actual program delivery costs should be used.

LOADSHAPE

Loadshape RE09 – Residential Indoor Lighting

Loadshape RE10 – Residential Outdoor Lighting

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

$$\Delta kWh = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * (WHFeHeat + (WHFeCool - 1))$$

Where:

Watts_{Base} = Based on lumens of CFL bulb installed and includes blend of incandescent/halogen⁶⁴², CFL and LED by weightings provided in table below⁶⁴³. Note that when an IA net-to-gross (NTG) factor is determined for this measure, this blended baseline should be replaced with the Incandescent/Halogen baseline only.

⁶⁴¹ Assumption based on 15 minutes (including portion of travel time) and \$40 per hour.

⁶⁴² Incandescent/Halogen wattage is based upon the ENERGY STAR specification for lamps

⁶³⁸ Incandescent/halogen and CFL costs are based on "2010-2012 WA017 Ex Ante Measure Cost Study Draft Report", Itron, February 28, 2014. LED lamp costs are based on a 2014/2015 VEIC review of a year's worth of LED sales through VEIC implemented programs. The retail cost was averaged and then DOE price projection trends (from Department of Energy, 2012; "Energy Savings Potential of Solid-State Lighting in General Illumination Applications", Table A.1) used to decrease the cost for a 2017 TBM assumption (see 2015 LED Sales Paviow via) LED soles are folling residue and should be saviewed in each update.

²⁰¹⁷ TRM assumption (see 2015 LED Sales Review.xls). LED costs are falling rapidly and should be reviewed in each update cycle.

⁶³⁹ Assumes 80% Incandescent/halogen, 10% CFL and 10% LED.

⁶⁴⁰ Average of lower wattage bins.

^{(&}lt;u>http://www.energystar.gov/sites/default/files/ENERGY%20STAR%20Lamps%20V1%201_Specification.pdf</u>) and the Energy Policy and Conservation Act of 2012.

⁶⁴³ Weightings were determined through discussions with the Technical Advisory Committee. These are based upon review of Itron socket saturation and inventory data, in addition to review of multiple other data sources on the lighting market in other jurisdictions.

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.5.2 Compact Fluorescent Lamp – Specialty

WattsEE = Actual wattage of energy efficient specialty bulb purchased – If unknown, assume the following defaults⁶⁴⁴:

Bulb Type		Lower Lumen	Upper Lumen	Inc/Halogen	Watts _{EE} CFL	LED	Watts _{Base}	Delta Watts

		Unknown ⁶⁵²	76.5%

Hours

= Average hours of use per year, varies by bulb type as presented below:

Installation Location	Hours
Residential Interior and in-unit Multifamily	894 ⁶⁵³
Exterior	2,475 ⁶⁵⁴
Unknown (e.g., Retail, Upstream and Efficiency Kits)	973 ⁶⁵⁵

WHFe_{Heat} = Waste Heat Factor for energy to account for electric heating increase from reducing waste heat from efficient lighting (if fossil fuel heating – see calculation of heating penalty in that section)

- = 1 ((HF / ŋHeat) * %ElecHeat)
- If unknown assume 0.94656

Where:

- HF = Heating Factor or percentage of light savings that must now be heated
 - = 53%⁶⁵⁷ for interior or unknown location
 - = 0% for exterior or unheated location

⁶⁵² Average of above.

⁶⁴⁶ All Programs except for Direct Install assume that some lamps are not installed in the first year but are later installed in years 2 and 3. To ease implementation, these future installs are discounted using the statewide real discount rate (7.71%); see "Res Lighting ISR calculation.xlsx" for more information.

⁶⁴⁷ In service rate for Retail CFLs is based upon recommendation in the Uniform Methods Project to use data from the Navigant Consulting and Apex Analytics (2013) study.

⁶⁴⁸ Based upon review of the Illinois PY2 and PY3 ComEd Direct Install program surveys; <u>http://www.ilsag.info/evaluation-</u> <u>documents.html</u>

⁶⁴⁹ Based on results provided in "School-based interim process memo_Final_100215.doc".

⁶⁵⁰ Average of above.

⁶⁵¹ Based on Cadmus, "Final Report: Iowa 2015 Energy Wise Program", January 29, 2016, p16.

 ⁶⁵³ Average of four Midwest metering studies: 2011 Ameren Missouri Lighting and Appliance Evaluation – PY 2; 2012 Consumers
 Energy - Technical Memo; 2012 DTE - Technical Memo; and PY5/PY6 ComEd, Illinois Residential Lighting Program evaluation.
 ⁶⁵⁴ Based on secondary research conducted as part of the Illinois PY5/PY6 ComEd Residential Lighting Program evaluation.

⁶⁵⁵ Assumes 5% exterior lighting, based on PYPY5/PY6 ComEd Residential Lighting Program evaluation.

⁶⁵⁶ Calculated using defaults: 1-((0.53/1.38) * 0.15) = 0.94.

⁶⁵⁷ This means that heating loads increase by 53% of the lighting savings. This is based on the average result from REMRate modeling of several different building configurations in Des Moines, Mason City, and Burlington.

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.5.2 Compact Fluorescent Lamp – Specialty

System Type	Age of Equipment	HSPF Estimate	ηHeat (COP Estimate)
Heat Pump	Before 2006	6.8	2.00
	2006-2014	7.7	2.26
	2015 and after	8.2	2.40
Resistance	N/A	N/A	1.00
Unknown	N/A	N/A	1.38 ⁶⁵⁹

η Heat_{Electric} = Efficiency in COP of Heating equipment

= Actual – If not available, use⁶⁵⁸:

Heating fuel	%ElecHeat
Electric	100%
Fossil Fuel	0%
Unknown	15% ⁶⁶⁰

WHFe_{Cool} = Waste Heat Factor for energy to account for cooling savings from reducing waste heat from efficient lighting

Bulb Location	WHFecool
Building with cooling	1.12 ⁶⁶¹
Building without cooling or exterior	1.0
Unknown	1.08662

For example, for a lamp sold through a retail program, an 800 lumen R lamp with medium screw base with 2.5" diameter:

∆kWh

= ((54.8 - 15.6) / 1000) * 0.92 * 973 * (0.94 + (1.08 - 1))

^{= 35.8} kWh

⁶⁵⁸ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 and 2015 the Federal Standard for Heat Pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time mean that using the minimum standard is appropriate.

⁶⁵⁹ Calculation assumes 33% Heat Pump and 67% Resistance, which is based upon data from Energy Information Administration, 2009 Residential Energy Consumption Survey, see "HC6.9 Space Heating in Midwest Region.xls". Average efficiency of heat pump is based on assumption 50% are units from before 2006 and 50% 2006-2014.

⁶⁶⁰ Based on data from Energy Information Administration, 2009 Residential Energy Consumption Survey, see "HC6.9 Space Heating in Midwest Region.xls".

⁶⁶¹ The value is estimated at 1.12 (calculated as 1 + (0.34 / 2.8)). Based on cooling loads decreasing by 34% of the lighting savings (average result from REMRate modeling of several different building configurations in Des Moines, Mason City, and Burlington), assuming typical cooling system operating efficiency of 2.8 COP (starting from standard assumption of SEER 10.5 central AC unit, converted to 9.5 EER using algorithm (-0.02 * SEER²) + (1.12 * SEER) (from Wassmer, M. (2003); A Component-Based Model for Residential Air Conditioner and Heat Pump Energy Calculations. Master's Thesis, University of Colorado at Boulder), converted to COP = EER/3.412 = 2.8COP).

⁶⁶² The value is estimated at 1.09 (calculated as 1 + (0.64*(0.34 / 2.8)). Based on assumption that 64% of homes have central cooling (based on 2009 Residential Energy Consumption Survey, see "HC7.9 Air Conditioning in Midwest Region.xls").

Iowa Energy Efficiency Statewide Technical Reference Manual — 2.5.2 Compact Fluorescent Lamp – Specialty

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * WHFdCool * CF$$

Where:

WHFdCool

= Waste Heat Factor for demand to account for cooling savings from efficient lighting.

Bulb Location	WHFdCool	
Building with cooling	1.22 ⁶⁶³	
Building without cooling or exterior	1.0	
Unknown (e.g., Retail, Upstream, and Efficiency Kits)	1.14 ⁶⁶⁴	

CF

= Summer peak Coincidence Factor for measure.

Bulb Location	CF
Residential Interior and in-unit Multifamily 665	13.1%
Exterior 666	1.8%
Unknown (e.g., Retail, Upstream, and Efficiency Kits) ⁶⁶⁷	12.5%

Other factors as defined above

For example, for a lamp sold through a retail program, an 800 lumen R lamp with medium screw base with 2.5" diameter:

ΔkW

= ((54.8 – 15.6) / 1,000) * 0.92 * 1.14 * 0.125 = 0.0051 kW

NATURAL GAS SAVINGS

Heating Penalty for Natural Gas heated homes⁶⁶⁸:

$$\Delta Therms = -\frac{\frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * HF * 0.03412}{\eta \text{Heat}} * \% \text{GasHeat}$$

Where:

HF

= Heating Factor or percentage of light savings that must now be heated

= 53%⁶⁶⁹ for interior or unknown location

 $^{^{663}}$ The value is estimated at 1.22 (calculated as 1 + (0.61 / 2.8)). See footnote relating to WHFe for details. Note the 61% factor represents the Residential cooling coincidence factor calculated using the average load during the peak period (as opposed to the peak hour) consistent with the lighting peak hours.

 $^{^{664}}$ The value is estimated at 1.14 (calculated as 1 + (0.64 * 0.61 / 2.8)).

⁶⁶⁵ Based on analysis of loadshape data provided by Cadmus.

⁶⁶⁶ Based on Itron eShapes lighting loadprofiles.

⁶⁶⁷ Assumes 5% exterior lighting, based on PYPY5/PY6 ComEd Residential Lighting Program evaluation.

⁶⁶⁸ Negative value because this is an increase in heating consumption due to the efficient lighting.

⁶⁶⁹ This means that heating loads increase by 53% of the lighting savings. This is based on the average result from REMRate modeling of several different building configurations in Des Moines, Mason City, and Burlington, IA.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.5.2 Compact Fluorescent Lamp – Specialty

	= 0% foi	= 0% for exterior location		
0.03412	=Conve	=Converts kWh to Therms		
$\eta Heat_{Gas}$	= Efficie	= Efficiency of heating system		
	=74% ⁶⁷⁰			
%GasHeat	= Percentage of homes with gas heat			
Heating fuel %GasHeat				
		Electric	0%	
		Electric Gas	0% 100%	

For example, for a lamp sold through a retail program, an 800 lumen R lamp with medium screw base with 2.5" diameter:

ΔTherms	= - ((((54.8 - 15.6) / 1000) * 0.92 * 973 * 0.53 * 0.03412) / 0.74) * 0.85
	= - 0.7 Therms

PEAK GAS SAVINGS

For ease of application, savings for this measure is assumed to be evenly spread across the year. The Peak Gas Savings is therefore assumed to be:

$$\Delta PeakTherms = \frac{\Delta Therms}{HeatDays}$$

Where:

ΔTherms	= Therm impact calculated above
HeatDays	= Heat season days per year
	= 217 ⁶⁷²

For example, using default assumptions provided in the example above:

ΔPeakTherms = - 0.7 /217 = -0.0032 therms

WATER IMPACT DESCRIPTIONS AND CALCULATION

N/A

⁶⁷⁰ This has been estimated assuming that natural gas central furnace heating is typical for lowa residences (the predominant heating is gas furnace with 49% of lowa homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey)). In 2000, 60% of furnaces purchased in lowa were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.60*0.92) + (0.40*0.8)) * (1-0.15) = 0.74.

⁶⁷¹ Based on data from Energy Information Administration, 2009 Residential Energy Consumption Survey, see "HC6.9 Space Heating in Midwest Region.xls".

⁶⁷² Number of days where HDD 60 >0.

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.5.2 Compact Fluorescent Lamp – Specialty

DEEMED O&M COST ADJUSTMENT CALCULATION

The O&M assumptions that should be used in cost effectiveness calculations are provided below:

Bulb Type	Installation Location	Replacement Period (years)	Replacement Cost ⁶⁷³
Directional	Residential Interior and in-unit Multifamily	4.8	
	Exterior	1.7	\$7.28 for < 20W,
	Unknown (e.g., Retail, Upstream, and Efficiency Kits)	4.4	\$10.56 for ≥20W
Decorative/Globe	Residential Interior and in-unit Multifamily	3.7	
	Exterior	1.3	\$4.73 for <15W,
	Unknown (e.g., Retail, Upstream, and Efficiency Kits)	3.4	\$5.54 for ≥15W
Unknown	Residential Interior and in-unit Multifamily	4.3	
	Exterior	1.5	\$6.01
	Unknown (e.g., Retail, Upstream, and Efficiency Kits)	3.9	\$0.UI

MEASURE CODE: RS-LTG-ESCS-V01-170101

SUNSET DATE: 1/1/2018

⁶⁷³ Incandescen/halogen and CFL costs based on "2010-2012 WA017 Ex Ante Measure Cost Study Draft Report", Itron, February 28, 2014. LED lamp costs are based on a 2014/2015 VEIC review of a year's worth of LED sales through VEIC implemented programs. The retail cost was averaged and then DOE price projection trends (from Department of Energy, 2012; "Energy Savings Potential of Solid-State Lighting in General Illumination Applications", Table A.1) used to decrease the cost for a 2017 TRM assumption (see 2015 LED Sales Review.xls). LED costs are falling rapidly and should be reviewed in each update cycle. Baseline based on 80% Incandescent/halogen, 10% CFL and 10% LED.

⁶⁷⁴ Calculated by dividing assumed rated life of baseline bulb by hours of use. Assumed lifetime of EISA qualified Halogen/ Incandescents is 1000 hours. The manufacturers are simply using a regular incandescent lamp with halogen fill gas rather than Halogen Infrared to meet the standard (as provided by G. Arnold, NEEP and confirmed by N. Horowitz at NRDC). Assumed lifetime of CFL is 10,000 and of LED is 25,000 hours. Values provided are an average based on 80% incandescent/halogen, 10% CFL and 10% LED (blended average of 4300 hours).

⁶⁷⁵ Assumed rated life of incandescent/halogen is 1000 hours, CFL is 10,000 and decorative LED is 15,000 hours. Values provided are an average based on 80% incandescent/halogen, 10% CFL and 10% LED (blended average of 3300 hours). ⁶⁷⁶ Values provided are an average of directional and decorative (blended average of 3800 hours).

Iowa Energy Efficiency Statewide Technical Reference Manual—2.5.3 LED Lamp – Standard

2.5.3 LED Lamp – Standard

DESCRIPTION

This characterization provides savings assumptions for LED Screw Based Omnidirectional (e.g., A-Type) lamps. This characterization provides assumptions for LEDs installed in a known location (i.e., residential and in-unit interior or exterior) or, if the implementation strategy does not allow for the installation location to be known (e.g., an upstream retail program or efficiency kit), an unknown residential location assumption is provided. For upstream programs, utilities should develop an assumption of the Residential v Nonresidential split and apply the relevant assumptions to each portion.

Federal legislation stemming from the Energy Independence and Security Act of 2007 (EISA) requires all generalpurpose light bulbs between 40W and 100W to be approximately 30% more energy efficient than standard incandescent bulbs. Production of 100W, standard efficacy incandescent lamps ended in 2012, followed by restrictions on 75W lamps in 2013 and 60W and 40W lamps in 2014. The baseline for this measure has therefore become bulbs (improved incandescent or halogen) that meet the new standard. Furthermore, the Technical Advisory Committee approved assuming a blended baseline condition of EISA qualified incandescent/halogen, CFL and LED lamps. This assumption should be reviewed during each update cycle and when the net to gross impacts for this measure are determined.

In December 2019, DOE issued a final determination for General Service Incandescent Lamps (GSILs), finding that the more stringent standards (45 lumen per watt) prescribed in the 2007 EISA regulation to become effective in 2020 (known as the 'Backstop' provision), were not economically justified. However, natural growth of LED market share has and will continue to grow over the lifetime of the measure, and since baseline halogens would need to be replaced multiple times within the life of the measure, a single mid-life adjustment is calculated that results in an equivalent net present value of lifetime savings as the forecast decline in annual savings.

This measure was developed to be applicable to the following program types: TOS, NC, RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, new lamps must be ENERGY STAR labeled based upon the v2.1 ENERGY STAR specification for lamps

(https://www.energystar.gov/sites/default/files/ENERGY%20STAR%20Lamps%20V2.1%20Final%20Specification_1.pdf) or CEE Tier 2 qualified. Specifications are as follows:

Efficiency Loyel	Lumens / watt		
Efficiency Level	CRI<90	CRI≥90	
ENERGY STAR v2.1	80	70	
CEE Tier 2 ⁶⁷⁷	95	80	

Qualification could also be based on the Design Light Consortium's qualified product list.⁶⁷⁸

DEFINITION OF BASELINE EQUIPMENT

The baseline condition for this measure is assumed to be a blend of 43% EISA qualified halogen or incandescent and 1% CFL and 56% baseline LED.⁶⁷⁹ The baseline is forecasted to continue to shift towards LEDs and therefore a mid-

⁶⁷⁷ Also required to have rated life of 25,000 hours and dimming capability.

⁶⁷⁸ https://www.designlights.org/QPL

⁶⁷⁹ Based on review of CREED LightTracker data from Illinios and DOE, 2019 'Energy Savings Forecast of Solid-State Lighting in General Illumination Applications'. See 'Lighting Forecast Workbook.xls'.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.5.3 LED Lamp – Standard

life adjustment is provided.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The rated life of omnidirectional LED lamps is assumed to be 20,230.⁶⁸⁰ This would imply a lifetime of 19 years for Residential interior and 8.2 years for Residential exterior; however, all installations are capped at 10 years,⁶⁸¹ so interior bulbs should assume a 10-year measure life.

DEEMED MEASURE COST

Wherever possible, actual incremental costs should be used. If unavailable, assume the following incremental costs:682

Lamp Type	CRI	Product Type	Cost	Incremental Cost
		Baseline	\$2.39	n/a
	<90	ESTAR LED	\$3.16	\$0.77
Standard		CEE T2 LED	\$3.29	\$0.90
A-lamp	>=90	Baseline	\$2.68	n/a
		ESTAR LED	\$3.67	\$0.99
		CEE T2 LED	\$3.75	\$1.07

LOADSHAPE

Loadshape RE09 – Residential Indoor Lighting

Loadshape RE10 – Residential Outdoor Lighting

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

$$\Delta kWh = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * (WHFeHeat + (WHFeCool - 1))$$

Where:

WattsBase

= Based on lumens of LED bulb installed and includes blend of incandescent/halogen,⁶⁸³ CFL and LED by weightings provided in table below.⁶⁸⁴ Note that when an IA net-to-gross (NTG) factor is determined for this measure, this blended baseline should be replaced with the Incandescent/Halogen baseline only.

⁶⁸¹ Based on recommendation in the Dunsky Energy Consulting, Livingston Energy Innovations and Opinion Dynamics

⁶⁸⁰ Average rated life of omnidirectional bulbs on the ENERGY STAR qualified products list as of June 5, 2018.

Corporation; NEEP Emerging Technology Research Report, p 6-18. Particularly in residential applications, lamps are susceptible to persistence issues such as removal, new occupants etc.

⁶⁸² Lamp costs are based upon WECC review of bulbs purchased through the Alliant program January – April 2017. The baseline cost reflects the baseline mix. See "2020 LED Measure Cost and O&M Calc.xls" for more information.

⁶⁸³ Incandescent/Halogen wattage is based upon the post first phase of EISA wattage.

⁶⁸⁴ Weightings based upon review of CREED LightTracker data for Illinois and DOE, 2019 'Energy Savings Forecast of Solid-State Lighting in General Illumination Applications'. See 'Lighting Forecast Workbook.xls'.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.5.3 LED Lamp – Standard

Electric	100%
Fossil Fuel	0%

⁶⁹⁴ Based on recommended value for standard LED lamps (2.98) in interior locations from Opinion Dynamics "Illinois Statewide Residential LED Hours of Use Study Additional Results," April 17, 2018.

 ⁶⁹⁵ Based on secondary research conducted as part of the Illinois PY5/PY6 ComEd Residential Lighting Program evaluation.
 ⁶⁹⁶ Assumes 5% exterior lighting, based on PYPY5/PY6 ComEd Residential Lighting Program evaluation.

⁶⁹⁷ Calculated using defaults; 1-((0.53/1.27) * 0.17) = 0.93.

⁶⁹⁸ This means that heating loads increase by 53% of the lighting savings. This is based on the average result from REMRate modeling of several different building configurations in Des Moines, Mason City, and Burlington, IA.

⁶⁹⁹ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Heat Pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

⁷⁰⁰ Calculation assumes 33% Heat Pump and 67% Resistance, which is based upon data from Energy Information Administration, 2009 Residential Energy Consumption Survey, see "HC6.9 Space Heating in Midwest Region.xls". Average efficiency of heat pump is based on the assumption that 50% are units from before 2006 and 50% 2006-2014.

WHFe_{Cool}

= Waste Heat Factor for energy to account for cooling savings from reducing waste heat from efficient lighting.

Bulb Location	WHFecool
Building with cooling	1.12 ⁷⁰²
Building without cooling or exterior	1.0
Unknown	1.11 ⁷⁰³

Mid-Life Baseline Adjustment

During the lifetime of a standard Omnidirectional LED, the baseline incandescent/halogen bulb would need to be replaced multiple times. In December 2019, DOE issued a final determination for General Service Incandescent Lamps (GSILs), finding that the more stringent standards (45 lumen per watt) prescribed in the 2007 EISA regulation to become effective in 2020 (known as the 'Backstop' provision), was not economically justified. However, natural growth of LED market share has, and will continue to grow over the lifetime of the measure, and so a single mid-life adjustment is calculated that results in an equivalent net present value of lifetime savings as the forecast decline in annual savings. See 'Lighting Forecast Workbook_2020.xls' for details.

The calculated mid-life adjustments for 2021 are provided below for each fixture type:

Lamp Category	Year on adjustment is applied	Adjustment
ENERGY STAR	5	45%
CEE Tier 2	5	51%

For example, a 11W LED lamp, 900 lumens, CRI 85, is purchased through retail in 2021:

 $\Delta kWh = ((25.3 - 11) / 1000) * 0.90 * 1,157 * (0.93 + (1.11 - 1))$ = 15.5 kWh

This value should be claimed for four years, but from year five until the end of the measure life for that same lamp, savings should be reduced to (15.5 * 0.45 =) 7.0 kWh for the remainder of the measure life. Note these adjustments should be applied to kW and fuel impacts as well.

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * WHFdCool * CF$$

⁷⁰¹ Based on Dunsky and Opinion Dynamics Baseline Study results.

⁷⁰² The value is estimated at 1.12 (calculated as 1 + (0.34 / 2.8)). Based on cooling loads decreasing by 34% of the lighting savings (average result from REMRate modeling of several different building configurations in Des Moines, Mason City, and Burlington), assuming typical cooling system operating efficiency of 2.8 COP (starting from standard assumption of SEER 10.5 central AC unit, converted to 9.5 EER using algorithm (-0.02 * SEER²) + (1.12 * SEER) (from Wassmer, M. (2003); A Component-Based Model for Residential Air Conditioner and Heat Pump Energy Calculations. Master's Thesis, University of Colorado at Boulder), converted to COP = EER/3.412 = 2.8COP).

⁷⁰³ The value is estimated at 1.11 (calculated as 1 + (0.88*(0.34 / 2.8)). Based on assumption that 88% of homes have central cooling (based on Dunsky and Opinion Dynamics Baseline Study results).

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.5.3 LED Lamp - Standard

Where:

WHFdCool

= Waste Heat Factor for demand to account for cooling savings from efficient lighting.

Bulb Location	WHFdCool
Building with cooling	1.22 ⁷⁰⁴
Building without cooling or exterior	1.0
Unknown (e.g. Retail, Upstream and Efficiency Kits)	1.19 ⁷⁰⁵

CF

Bulb Location	CF
Residential Interior and in-unit Multifamily 706	13.1%
Exterior 707	1.8%
Unknown (e.g., Retail, Upstream, and Efficiency Kits) ⁷⁰⁸	12.5%

Other factors as defined above.

For example, fo	or a 11W LED lamp, 900 lumens, purchased through retail in 2021:
ΔkW	= ((25.3–11) /1000) * 0.90 * 1.19 * 0.125
	= 0.0019 kW

NATURAL GAS SAVINGS

HF

Where:

Heating Penalty for Natural Gas heated homes:⁷⁰⁹

$$\Delta Therms = -\frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * HF * 0.03412}{\eta \text{Heat}} * \% \text{GasHeat}$$

$$= \text{Heating Factor or percentage of light savings that must now be heated}$$

$$= 53\% \text{ for interior or unknown location}^{710}$$

= 0% for exterior or unheated location	
--	--

0.03412	=Converts kWh to Therms

ηHeat_{Gas} = Efficiency of heating system

=74%⁷¹¹

 $^{^{704}}$ The value is estimated at 1.22 (calculated as 1 + (0.61 / 2.8)). See footnote relating to WHFe for details. Note the 61% factor represents the Residential cooling coincidence factor calculated using the average load during the peak period (as opposed to the peak hour) consistent with the lighting peak hours.

⁷⁰⁵ The value is estimated at 1.19 (calculated as 1 + (0.88 * 0.61 / 2.8)).

⁷⁰⁶ Based on analysis of loadshape data provided by Cadmus.

⁷⁰⁷ Based on Itron eShapes lighting loadprofiles.

⁷⁰⁸ Assumes 5% exterior lighting, based on PYPY5/PY6 ComEd Residential Lighting Program evaluation.

⁷⁰⁹ Negative value because this is an increase in heating consumption due to the efficient lighting.

⁷¹⁰ This means that heating loads increase by 53% of the lighting savings. This is based on the average result from REMRate modeling of several different building configurations in Des Moines, Mason City, and Burlington, IA.

⁷¹¹ This has been estimated assuming that natural gas central furnace heating is typical for lowa residences (the predominant

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.5.3 LED Lamp - Standard

%GasHeat

= Percentage of homes with gas heat

Heating fuel	%GasHeat
Electric	0%
Gas	100%
Unknown	83% ⁷¹²

For example, for a 11W LED lamp, 900 lumens, purchased through retail in 2021:								
ΔTherms	= - ((((25.3 - 11) / 1000) * 0.90 * 1,157 * 0.53 * 0.03412) / 0.74) * 0.83							
	= - 0.30 therms							

PEAK GAS SAVINGS

For ease of application, savings for this measure is assumed to be evenly spread across the year. The Peak Gas Savings is therefore assumed to be:

$$\Delta PeakTherms = \frac{\Delta Therms}{HeatDays}$$

Where:

ΔTherms	= Therm impact calculated above
HeatDays	= Heat season days per year
	= 217 ⁷¹³

For example, for a 11W LED lamp, 900 lumens, purchased through retail in 2019:

ΔPeakTherms = - 0.30 /217 = -0.0014 therms

WATER IMPACT DESCRIPTIONS AND CALCULATION

N/A

DEEMED O&M COST ADJUSTMENT CALCULATION

In order to account for the shift in baseline due to the natural growth of LED over the lifetime of the measure, an annual levelized baseline replacement cost over the lifetime of the LED bulb is calculated. Bulb replacement costs assumed in the O&M calculations are provided below.⁷¹⁴

CRI	Product Type	Cost
<90	Inc/Hal	\$1.40

heating is gas furnace with 49% of Iowa homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey)). In 2000, 60% of furnaces purchased in Iowa were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.60*0.92) + (0.40*0.8)) * (1-0.15) = 0.74.

⁷¹² Based on Dunsky and Opinion Dynamics Baseline Study results

 $^{^{713}}$ Number of days where HDD 60 >0.

⁷¹⁴ Lamp costs are based upon WECC review of bulbs purchased through the Alliant program January – April 2017 and equivalent baseline bulbs.

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.5.4 LED Lamp - Specialty

2.5.4 LED Lamp – Specialty

DESCRIPTION

This characterization provides savings assumptions for LED Directional, Decorative, and Globe lamps. This characterization provides assumptions for when the LED is installed in a known location (i.e., residential and in-unit interior or exterior) or, if the implementation strategy does not allow for the installation location to be known (e.g., an upstream retail program or efficiency kit), an unknown residential location assumption is provided. For upstream programs, utilities should develop an assumption of the Residential v Nonresidential split and apply the relevant assumptions to each portion.

The Technical Advisory Committee approved assuming a blended baseline condition of incandescent/halogen, CFL and LED lamps. This assumption should be reviewed during each update cycle and when the net to gross impacts for this measure are determined.

A DOE Final Rule released on 1/19/2017 updated the definition of General Service Lamps (GSL) as provided in the 2009 Energy Independence and Security Act (EISA) such that the lamp types characterized in this measure would become subject to the backstop provision in EISA, which requires that after January 1, 2020, all lamps meet efficiency criteria of at least 45 lumens per watt.

On 9/5/2019 DOE repealed the 2017 Final rule, preventing this expansion of the definition of General Service Lamp to include these lamps. However, natural growth of LED market share has, and will continue to grow over the lifetime of the measure, and since baseline halogens would need to be replaced multiple times within the life of the measure, a single mid-life adjustment is calculated that results in an equivalent net present value of lifetime savings as the forecasted decline in annual savings.

This measure was developed to be applicable to the following program types: TOS, NC, RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, new lamps must be ENERGY STAR labeled based upon the v2.1 ENERGY STAR specification for lamps

(https://www.energystar.gov/sites/default/files/ENERGY%20STAR%20Lamps%20V2.1%20Final%20Specification_1.pdf) or CEE Tier 2 qualified. Specifications are as follows:

Efficiency Loyal		Lumens / watt				
Efficiency Level	Lamp Type	CRI<90	CRI≥90			
ENERGY STAR v2.1	Directional	70	61			
ENERGY STAR V2.1	Decorative / Globe	65	65			
CEE Tier 2 ⁷¹⁶	Directional	85	70			
CEE Her Z	Decorative / Globe	95	80			

Qualification could also be based on the Design Light Consortium's qualified product list.⁷¹⁷

DEFINITION OF BASELINE EQUIPMENT

The baseline condition for this measure is assumed to be a blend of 46% EISA qualified halogen or incandescent and 54% baseline LED for decorative and globe lamps, and 15% EISA qualified halogen or incandescent and 85% baseline LED for decorative and globe lamps.⁷¹⁸ Lamp types include those exempt of the EISA 2007 standard: three-way,

⁷¹⁶ Also required to have dimming capability.

⁷¹⁷ https://www.designlights.org/QPL

⁷¹⁸ Based on review of CREED LightTracker data for Illinois and DOE, 2019 'Energy Savings Forecast of Solid-State Lighting in General Illumination Applications'. See 'Lighting Forecast Workbook.xls'.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.5.4 LED Lamp – Specialty

plant light, daylight bulb, bug light, post light, globes G40 (≤40W equivalent (We)), candelabra base (≤60We), vibration service bulb, decorative candle with medium or intermediate base (≤40We), shatter resistant, and reflector bulbs, and standard bulbs greater than 2601 lumens, and those non-exempt from EISA 2007: dimmable, globes (less than 5" diameter and >40We), candle (shapes B, BA, CA >40We), candelabra base lamps (>60We), and intermediate base lamps (>40We). Note however that all lamps are subject to a baseline shift to account for the natural growth in LEDs over the lifetime of the measure.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The rated life for directional bulbs is assumed to be 25,042 and for decorative bulbs, 17,129 hours.⁷¹⁹ This would imply a lifetime of 33 years for residential interior directional, 10 years for residential exterior directional, 22.4 years for residential interior decorative, and 6.9 years for residential exterior decorative; however, all installations are capped at 10 years.⁷²⁰

DEEMED MEASURE COST

Wherever possible, actual incremental costs should be used. If unavailable assume the following incremental costs:⁷²¹

Bulb Type	CRI	Product Type	Cost	Incremental Cost		
		Baseline	\$7.38	n/a		
	<90	ESTAR LED	\$7.80	\$0.42		
Directional		CEE T2 LED	CEE T2 LED \$18.96 \$1			
Directional		Baseline	\$7.23	n/a		
	>=90	ESTAR LED	\$7.63	\$0.39		
		CEE T2 LED	\$18.54	\$11.31		
		Baseline	\$5.43	n/a		
	<90	ESTAR LED	\$7.50	\$2.07		
Decorative		CEE T2 LED	\$7.83	\$2.40		
Decorative		Baseline	\$6.07	n/a		
	>=90	ESTAR LED	\$8.69	\$2.62		
		CEE T2 LED	\$9.08	\$3.00		

LOADSHAPE

Loadshape RE09 – Residential Indoor Lighting

Loadshape RE10 – Residential Outdoor Lighting

⁷¹⁹ Average rated life of directional and decorative bulbs on the ENERGY STAR qualified products list as of April, 2020.

⁷²⁰ Based on recommendation in the Dunsky Energy Consulting, Livingston Energy Innovations, and Opinion Dynamics

Corporation; NEEP Emerging Technology Research Report, p 6-18. Particularly in residential applications, lamps are susceptible to persistence issues such as removal, new occupants, etc.

⁷²¹ Lamp costs are based upon WECC review of bulbs purchased through the Alliant program January – April 2017. The baseline cost reflects the baseline mix. See "2020 LED Measure Cost and O&M Calc.xls" for more information.

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.5.4 LED Lamp - Specialty

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

$$\Delta kWh = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * (WHFeHeat + (WHFeCool - 1))$$

Where:

Watts_{Base} = Based on lumens of LED bulb installed and includes blend of incandescent/halogen,⁷²² CFL and LED by weightings provided in table below.⁷²³ Note that when an IA net-to-gross (NTG) factor is determined for this measure, this blended baseline should be replaced with the Incandescent/Halogen baseline only.

WattsEE = Actual wattage of LED purchased / installed. If unknown, use default provided below:⁷²⁴

⁷²² Incandescent/Halogen wattage is based upon the ENERGY STAR specification for lamps

^{(&}lt;u>http://www.energystar.gov/sites/default/files/ENERGY%20STAR%20Lamps%20V1%201_Specification.pdf</u>) and the Energy Policy and Conservation Act of 2012.

⁷²³ Weightings based on review of CREED LightTracker data and DOE, 2019 'Energy Savings Forecast of Solid-State Lighting in General Illumination Applications'. See 'Lighting Forecast Workbook.xls'.

⁷²⁴ Watts_{EE} defaults are based upon the ENERGY STAR minimum luminous efficacy (for the mid-point of the lumen range). See calculations in file "2017 Lighting Updates and Baseline Estimates."

⁷²⁹ Weighted average is based on 2018 and 2019 data provided by MidAmerican and Alliant. Assumes ENERGY STAR CRI<90 for the efficient wattage.

Iowa Energy Efficiency Statewide Technical Reference Manual — 2.5.4 LED Lamp – Specialty

ISR

= In Service Rate, the percentage of units rebated that are actually in service

	Program	Discounted In Service Rate (ISR) ⁷³⁰		
Retail (Time	e of Sale) ⁷³¹	90%		
Direct Insta	⁷³²	97%		
Efficiency	School Kits ⁷³³		60%	
Efficiency Kits	EnergyWise Income) ⁷³⁴	(Low	79%	

Hours

= Average hours of use per year

Installation Location	Hours
Residential Interior and in-unit Multifamily	763 ⁷³⁵
Exterior	2,475 ⁷³⁶
Unknown (e.g., Retail, Upstream, and Efficiency Kits)	1,020 ⁷³⁷

WHFe_{Heat} = Waste Heat Factor for energy to account for electric heating increase from reducing waste heat from efficient lighting (if fossil fuel heating – see calculation of heating penalty in that section).

= $1 - ((HF / \eta Heat) * \% ElecHeat)$

If unknown assume 0.93738

Where:

- HF = Heating Factor or percentage of light savings that must now be heated
 - = 53% for interior or unknown location⁷³⁹
 - = 0% for exterior or unheated location

⁷³⁰ All Programs except for Direct Install assume that some lamps are not installed in the first year but are later installed in years 2 and 3. To ease implementation, these future installs are discounted using the statewide real discount rate (7.71%). The second and third year installations rates are from NREL, "Chapter 6: Residential Lighting Evaluation Protocol of the Uniform Methods Project," October 2017. See "Res Lighting ISR calculation_2019.xlsx" for more information.

 $^{^{731}\,1^{}st}$ year in service rate is a weighted average of ComEd PY7, PY8 and PY9 intercept data.

⁷³² Based upon review of the Illinois PY2 and PY3 ComEd Direct Install program surveys. <u>http://www.ilsag.info/evaluation-</u> <u>documents.html</u>

⁷³³ In Service Rates provided are for the bulb within a kit only. Kits provided free to students through school, with education program. 1st year ISR for school kits based on ComEd PY9 data for the Elementary Energy Education program.

⁷³⁴ Based on Cadmus, "Final Report: Iowa 2015 Energy Wise Program", January 29, 2016, p16.

⁷³⁵Based on recommended value for specialty LED lamps (2.09) in interior locations from Opinion Dynamics "Illinois Statewide Residential LED Hours of Use Study Additional Results," April 17, 2018.

⁷³⁶ Based on secondary research conducted as part of the Illinois PY5/PY6 ComEd Residential Lighting Program evaluation.

⁷³⁷ Based on a weighted average of interior and exterior hours of use from the IL Statewide LED Lighting Logger study conducted as part of the PY8/PY9 evaluations of the Ameren Illinois and ComEd Residential Lighting programs, finding 15% exterior specialty lighting.

⁷³⁸ Calculated using defaults: 1-((0.53/1.27) * 0.17) = 0.93

⁷³⁹ This means that heating loads increase by 53% of the lighting savings. This is based on the average result from REMRate modeling of several different building configurations in Des Moines, Mason City, and Burlington, IA.

Iowa Energy Efficiency Statewide Technical Reference Manual — 2.5.4 LED Lamp – Specialty

nHeatElectric

= Efficiency in COP of Heating equipment

= Actual system efficiency including duct loss – If not available, use:⁷⁴⁰

System Type	Age of Equipment	HSPF Estimate	ηHeat (Effective COP Estimate) (HSPF/3.412)*0.85
	Before 2006	6.8	1.7

WHFecool

= Waste Heat Factor for energy to account for cooling savings from reducing waste heat from efficient lighting.

Bulb Location	WHFecool
Building with cooling	1.12 ⁷⁴³
Building without cooling or exterior	1.0
Unknown	1.11 ⁷⁴⁴

Mid-Life Baseline Adjustment

During the lifetime of an LED, the baseline incandescent/halogen bulb would need to be replaced multiple times. The market share of LED will continue to grow over the lifetime of the measure, and since baseline halogens would need to be replaced multiple times within the life of the measure, a single mid-life adjustment is calculated that results in an equivalent net present value of lifetime savings as the forecasted decline in annual savings. See 'Lighting Forecast Workbook 2020.xls' for details.

⁷⁴⁰ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Heat Pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

⁷⁴¹ Calculation assumes 33% Heat Pump and 67% Resistance, which is based upon data from Energy Information Administration, 2009 Residential Energy Consumption Survey, see "HC6.9 Space Heating in Midwest Region.xls". Average efficiency of heat pump is based on the assumption that 50% are units from before 2006 and 50% 2006-2014. ⁷⁴² Based on Dunsky and Opinion Dynamics Baseline Study results.

 $^{^{743}}$ The value is estimated at 1.12 (calculated as 1 + (0.34 / 2.8)). Based on cooling loads decreasing by 34% of the lighting savings (average result from REMRate modeling of several different building configurations in Des Moines, Mason City, and Burlington), assuming typical cooling system operating efficiency of 2.8 COP (starting from standard assumption of SEER 10.5 central AC unit, converted to 9.5 EER using algorithm (-0.02 * SEER²) + (1.12 * SEER) (from Wassmer, M. (2003); A Component-Based Model for Residential Air Conditioner and Heat Pump Energy Calculations. Master's Thesis, University of Colorado at Boulder), converted to COP = EER/3.412 = 2.8COP).

⁷⁴⁴ The value is estimated at 1.11 (calculated as 1 + (0.88*(0.34 / 2.8)). Based on assumption that 88% of homes have central cooling (based on Dunsky and Opinion Dynamics Baseline Study results).

Iowa Energy Efficiency Statewide Technical Reference Manual—2.5.4 LED Lamp – Specialty

Lamp Category	Efficiency Level	Year on adjustment is applied	Adjustment
Deservitive and Clobe lamos	ENERGY STAR		57%
Decorative and Globe lamps	CEE Tier 2	5	63%
Directional laws	ENERGY STAR	5	62%
Directional lamps	CEE Tier 2	5	69%

The calculated mid-life adjustments for 2021 are provided below for each fixture type:

This reduced annual savings will need to be incorporated in to cost effectiveness screening calculations. The baseline adjustment also impacts the O&M schedule.

For example, for a 5W LED lamp, 200 lumens, 85 CRI decorative LED bulb purchased through retail in 2021: $\Delta kWh = ((13.7 - 5) / 1000) * 0.90 * 1,020 * (0.93 + (1.11 - 1))$ = 8.3 kWh

This value should be claimed for five years, but from year five until the end of the measure life for that same lamp, savings should be reduced to (8.3 * 0.57 =) 4.7 kWh for the remainder of the measure life. Note these adjustments should be applied to kW and fuel impacts as well.

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * WHFdCool * CF$$

Where:

WHFdCool

= Waste Heat Factor for demand to account for cooling savings from efficient lighting.

Bulb Location	WHFdCool
Building with cooling	1.22 ⁷⁴⁵
Building without cooling or exterior	1.0
Unknown (e.g., Retail, Upstream, and Efficiency Kits)	1.19 ⁷⁴⁶

CF

= Summer Peak Coincidence Factor for measure.

Bulb Location	CF
Residential Interior and in-unit Multifamily 747	13.1%
Exterior 748	1.8%
Unknown (e.g., Retail, Upstream, and Efficiency Kits) ⁷⁴⁹	11.4%

 $^{^{745}}$ The value is estimated at 1.22 (calculated as 1 + (0.61 / 2.8)). See footnote relating to WHFe for details. Note the 61% factor represents the Residential cooling coincidence factor calculated using the average load during the peak period (as opposed to the peak hour) consistent with the lighting peak hours.

⁷⁴⁶ The value is estimated at 1.19 (calculated as 1 + (0.88 * 0.61 / 2.8)).

⁷⁴⁷ Based on analysis of loadshape data provided by Cadmus.

⁷⁴⁸ Based on Itron eShapes lighting loadprofiles.

⁷⁴⁹ Assumes 15% exterior lighting, based on IL Statewide LED Lighting Logger study conducted as part of the PY8/PY9 evaluations of the Ameren Illinois and ComEd Residential Lighting programs.

Iowa Energy Efficiency Statewide Technical Reference Manual — 2.5.4 LED Lamp – Specialty

Other factors as defined above

For example, for a 5W LED lamp, 200 lumens, decorative LED bulb purchased through retail in 2021:			
ΔkW	= ((13.7 – 5) /1000) * 0.90 * 1.19 * 0.114		
	= 0.0011 kW		

NATURAL GAS SAVINGS

Heating Penalty for Natural Gas heated homes:⁷⁵⁰

$\Delta Therms = -$	$\frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * HF * 0.03412$	* %GasHeat
$\Delta I herms = -$	ηHeat	* 700asileat

Where:

HF	= Heating Factor or percentage of light savings that must be heated
	= 53% for interior or unknown location ⁷⁵¹
	= 0% for exterior or unheated location
0.03412	=Converts kWh to Therms
$\eta Heat_{Gas}$	= Efficiency of heating system
	=74% ⁷⁵²
%GasHeat	= Percentage of homes with gas heat

Heating fuel	%GasHeat
Electric	0%
Gas	100%
Unknown	83% ⁷⁵³

For example, for a 5W LED lamp, 200 lumens, decorative LED bulb purchased through retail in 2021:			
ΔTherms	= - ((((13.7 - 5) / 1000) * 0.90 * 1,020 * 0.53 * 0.03412) / 0.74) * 0.83		
	= - 0.16 therms		

PEAK GAS SAVINGS

For ease of application, savings for this measure is assumed to be evenly spread across the year. The Peak Gas Savings is therefore assumed to be:

⁷⁵⁰ Negative value because this is an increase in heating consumption due to the efficient lighting.

⁷⁵¹ This means that heating loads increase by 53% of the lighting savings. This is based on the average result from REMRate modeling of several different building configurations in Des Moines, Mason City, and Burlington, IA.

⁷⁵² This has been estimated assuming that natural gas central furnace heating is typical for lowa residences (the predominant heating is gas furnace with 49% of Iowa homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey)). In 2000, 60% of furnaces purchased in Iowa were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.60*0.92) + (0.40*0.8)) * (1-0.15) = 0.74.

⁷⁵³ Based on Dunsky and Opinion Dynamics Baseline Study results

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.5.4 LED Lamp - Specialty

	$\Delta PeakTherms = \frac{\Delta Therms}{HeatDays}$	
Where:		
	ΔTherms	= Therm impact calculated above
	HeatDays	= Heat season days per year
		= 217 ⁷⁵⁴

For example, for a 5W LED lamp, 200 lumens, decorative LED bulb purchased through retail in 2020:ΔPeakTherms= - 0.16 /217= -0.00074 therms

WATER IMPACT DESCRIPTIONS AND CALCULATION

N/A

DEEMED O&M COST ADJUSTMENT CALCULATION

In order to account for the shift in baseline due to the natural growth of LED over the lifetime of the measure, an annual levelized baseline replacement cost over the lifetime of the LED bulb is calculated. Bulb replacement costs assumed in the O&M calculations are provided below.⁷⁵⁵

Lamp Type	CRI	Product Type	Cost
	<90	Inc/Hal	\$5.00
Directional		LED	\$7.80
Directional	>=90	Inc/Hal	\$5.00
		LED	\$7.63
	<90	Inc/Hal	\$3.00
Decorative		LED	\$7.50
	>=90	Inc/Hal	\$3.00
		LED	\$8.69

 $^{^{754}}$ Number of days where HDD 60 >0.

⁷⁵⁵ Lamp costs are based upon WECC review of bulbs purchased through the Alliant program January – April 2017 and equivalent baseline bulbs.

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.5.4 LED Lamp - Specialty

The present value of replacement lamps and annual levelized replacement costs using the statewide real discount rate of 7.20% are presented below:⁷⁵⁶

			PV of replacement costs for period	Levelized annual replacement cost savings
Lamp Type	CRI	Location	2021 Installs	2021 Installs
	<00	Residential and in-unit Multifamily	\$3.69	\$0.53

⁷⁵⁶ See "2020 LED Measure Cost and O&M Calc.xlsx " for more information.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.5.5 LED Exit Signs

2.5.5 LED Exit Signs

DESCRIPTION

This measure characterizes the savings associated with installing a Light Emitting Diode (LED) exit sign in place of an existing fluorescent/compact fluorescent (CFL) or incandescent exit sign in a Multifamily building. LED exit signs use a lower wattage of power (\leq 5 Watts) and have a significantly longer life compared to standard signs that can use up to 40 watts.⁷⁵⁷ This in addition to reduced maintenance needs, and characteristic low-temperature light quality makes LED exit signs a superior option compared to other exit sign technologies available today.

This measure was developed to be applicable to the following program types: RF, DI.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient equipment is assumed to be an exit sign illuminated by LEDs with an input power demand of 5 watts or less per face.⁷⁵⁸

DEFINITION OF BASELINE EQUIPMENT

The baseline is the existing system (either a CFL or incandescent unit)

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure life is assumed to be 13 years.⁷⁵⁹

DEEMED MEASURE COST

The actual material and labor costs should be used if available. If actual costs are unavailable, assume a total installed cost of \$49.760

LOADSHAPE

Loadshape E01 – Flat

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS⁷⁶¹

 $\Delta kWh = \left(\frac{Watts_{\text{bBase}} - Watts_{\text{EE}}}{1000}\right) * Hours * (WHFeHeat + (WHFeCool - 1))$

Where:

Watts_{Base} = Actual wattage if known, if unknown assume the following:

⁷⁵⁷ ENERGY STAR "Save Energy, Money and Prevent Pollution with LED Exit Signs"

⁷⁵⁸ ENERGY STAR "*Program Requirements for Exit Signs – Eligibility Criteria*" Version.3. While the EPA suspended the ENERGY STAR Exit Sign specification effective May 1, 2008, Federal requirements specify minimum efficiency standards for electrically-powered, single-faced exit signs with integral lighting sources that are equivalent to ENERGY STAR levels for input power demand of 5 watts or less per face.

 ⁷⁵⁹ GDA Associates Inc. "Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures", June 2007.
 ⁷⁶⁰ Price includes new exit sign/fixture and installation. EPA ENERGY STAR Exit Sign Calculator estimates LED cost/unit is \$39 and assuming IA labor cost of 15 minutes @ \$40/hr.

⁷⁶¹ There is no ISR calculation. Exit signs and emergency lighting are required by federal regulations to be installed and functional in all public buildings as outlined by the U.S. Occupational Safety and Health Standards (USOSHA 1993).

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.5.5 LED Exit Signs

Project Type	Baseline Type	WattsBase
Retrofit/Direct Install ⁷⁶²	Incandescent (dual sided)	40W ⁷⁶³
	Incandescent (single sided)	20W
	CFL (dual sided)	14W ⁷⁶⁴
	CFL (single sided)	7W

WattsEE = Actual wattage if known, if unknown assume singled sided 2W and dual sided 4W⁷⁶⁵

Hours = Annual operating hours

= 8766

WHFe_{Heat} = Waste Heat Factor for energy to account for electric heating increase from reducing waste heat from efficient lighting (if fossil fuel heating – see calculation of heating penalty in that section).

= $1 - ((HF / \eta Heat) * \% ElecHeat)$

If unknown, assume 0.93766

- HF = Heating Factor or percentage of light savings that must be heated
 - = 53%⁷⁶⁷ for interior or unknown location
 - = 0% for exterior or unheated location
- ηHeat = Efficiency in COP of Heating equipment
 - = Actual system efficiency including duct loss If not available, use:⁷⁶⁸

System Type	Age of Equipment	HSPF Estimate	ηHeat (Effective COP Estimate) (HSPF/3.412)*0.85
	Before 2006	6.8	1.7
Heat Pump	2006 - 2014	7.7	1.92
	2015 on	8.2	2.04
Resistance	N/A	N/A	1
Unknown	N/A	N/A	1.27 ⁷⁶⁹

⁷⁶² If program type does not know baseline assume the ratio of present incandescent to fluorescent exit sign units to be a deemed a weighted baseline of 70% incandescent to 30% CFL = 32.2W. This ratio has been used by ComEd and is reflective of program experience. In lieu of IA specific market research, we consider this evaluation to be reasonable.

⁷⁶⁶ Calculated using defaults; 1-((0.53/1.27) * 0.17) = 0.93

⁷⁶⁹ Calculation assumes 33% Heat Pump and 67% Resistance, which is based upon data from Energy Information

⁷⁶³. Average incandescent watts are assumed at 40W as listed by the U.S. Department of Energy, ENERGY STARY Life Cycle Cost Exit-Sign Calculator available at https://www.energystar.gov/index.cfm?c=exit_signs.pr exit_signs.

⁷⁶⁴ Average CFL single sided (5W, 7W, 9W) from Appendix B 2013-14 Table of Standard Fixture Wattages. Available at: <u>http://www.aesc-inc.com/download/spc/2013SPCDocs/PGE/App%20B%20Standard%20Fixture%20Watts.pdf</u>

⁷⁶⁵ Average Exit LED watts are assumed as a 2W as listed in Appendix B 2013-14 Table of Standard Fixture Wattages. Available at: http://www.aesc-inc.com/download/spc/2013SPCDocs/PGE/App%20B%20Standard%20Fixture%20Watts.pdf

⁷⁶⁵ Average LED single sided (2W) from Appendix B 2013-14 Table of Standard Fixture Wattages. Available at: <u>http://www.aesc-inc.com/download/spc/2013SPCDocs/PGE/App%20B%20Standard%20Fixture%20Watts.pdf</u>

⁷⁶⁷ This means that heating loads increase by 53% of the lighting savings. This is based on the average result from REMRate modeling of several different building configurations in Des Moines, and Mason City and Burlington.

⁷⁶⁸ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Heat Pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.5.5 LED Exit Signs

%ElecHeat

Heating fuel	%ElecHeat
Electric	100%
Fossil Fuel	0%
Unknown	17% ⁷⁷⁰

WHFe_{Cool} = Waste Heat Factor for energy to account for cooling savings from reducing waste heat from efficient lighting.

= Percentage of home with electric heat

Bulb Location	WHFecool
Building with cooling	1.12 ⁷⁷¹
Building without cooling or exterior	1.0
Unknown	1.11 ⁷⁷²

For example, for a 4W, dual sided LED exit sign replacing a CFL lamp in electrically heated building with cooling: $\Delta kWh = ((14-4) / 1000) * 8,766 * (0.58 + (1.12 - 1))$ = 61.4 kWh

SUMMER COINCIDENT PEAK DEMAND SAVINGS773

$$\Delta kW = \frac{Watts_{Base} - Watts_{EE}}{1,000} * WHFdCool * CF$$

Where:

WHFd_{Cool}

= Waste Heat Factor for demand to account for cooling savings from efficient lighting

Bulb Location	WHFdCool
Building with cooling	1.22 ⁷⁷⁴
Building without cooling or exterior	1.0
Unknown	1.19 ⁷⁷⁵

CF

= Summer peak Coincidence Factor for this measure

⁷⁷⁵ The value is estimated at 1.19 (calculated as 1 + (0.88 * 0.61 / 2.8)).

Administration, 2009 Residential Energy Consumption Survey, see "HC6.9 Space Heating in Midwest Region.xls". Average efficiency of heat pump is based on the assumption that 50% are units from before 2006 and 50% 2006-2014. ⁷⁷⁰ Based on Dunsky and Opinion Dynamics Baseline Study results.

⁷⁷¹ The value is estimated at 1.12 (calculated as 1 + (0.34 / 2.8)). Based on cooling loads decreasing by 34% of the lighting savings (average result from REMRate modeling of several different building configurations in Des Moines, and Mason City and Burlington), assuming typical cooling system operating efficiency of 2.8 COP (starting from standard assumption of SEER 10.5 central AC unit, converted to 9.5 EER using algorithm (-0.02 * SEER2) + (1.12 * SEER) (from Wassmer, M. (2003); A Component-Based Model for Residential Air Conditioner and Heat Pump Energy Calculations. Master's Thesis, University of Colorado at Boulder), converted to COP = EER/3.412 = 2.8COP).

⁷⁷² The value is estimated at 1.11 (calculated as 1 + (0.88*(0.34 / 2.8)). Based on assumption that 88% of homes have central cooling (based on Dunsky and Opinion Dynamics Baseline Study results).

⁷⁷³ There is no ISR calculation. Exit signs and emergency lighting are required by federal regulations to be installed and functional in all public buildings as outlined by the U.S. Occupational Safety and Health Standards (USOSHA 1993).

 $^{^{774}}$ The value is estimated at 1.22 (calculated as 1 + (0.61 / 2.8)). See footnote relating to WHFe for details. Note the 61% factor represents the Residential cooling coincidence factor calculated using the average load during the peak period (as opposed to the peak hour) consistent with the lighting peak hours.

Iowa Energy Efficiency Statewide Technical Reference Manual-2.5.5 LED Exit Signs

= 1.0⁷⁷⁶

For example, for a 4W, dual sided LED exit sign replacing a CFL lamp in a building with cooling: $\Delta kW = ((14 - 4) / 1000) * 1.22 * 1.0$ = 0.0122 kW

NATURAL GAS ENERGY SAVINGS

Heating Penalty for Natural Gas heated homes:777

 $\Delta Therms = -\frac{\frac{Watts_{Base} - Watts_{EE}}{1,000} * Hours * HF * 0.03412}{\eta \text{HeatGas}} * \% \text{GasHeat}$

Where:

HF

:	= Heating factor, or percentage of lighting savings that must be replaced by heating system.
	= 53% for interior or unknown location ⁷⁷⁸
	= 0% for exterior or unheated location

ηHeat _{Gas}	= Efficiency of heating system
----------------------	--------------------------------

= 74%⁷⁷⁹

%GasHeat = Percentage of homes with gas heat

Heating fuel	%GasHeat
Electric	0%
Gas	100%
Unknown	83% ⁷⁸⁰

For example, for a 4W, dual sided LED exit sign replacing a CFL lamp in gas heated building:		
ΔTherms	= - ((((14 – 4) /1000) * 8,766 * 0.53 * 0.03412)/0.74) * 1.0	
	= - 2.1 therms	

PEAK GAS SAVINGS

For ease of application, savings for this measure is assumed to be evenly spread across the year. The Peak Gas Savings

 ⁷⁷⁶ 776 Assuming continuous operation of an LED exit sign, the Summer Peak Coincidence Factor is assumed to equal 1.0.
 ⁷⁷⁷ Results in a negative value because this is an increase in heating consumption due to the efficient lighting.

⁷⁷⁸ This means that heating loads increase by 53% of the lighting savings. This is based on the average result from REMRate modeling of several different building configurations in Des Moines, Mason City, and Burlington, IA.

⁷⁷⁹ This has been estimated assuming that natural gas central furnace heating is typical for Iowa residences (the predominant heating is gas furnace with 49% of Iowa homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey)). In 2000, 60% of furnaces purchased in Iowa were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.60*0.92) + (0.40*0.8)) * (1-0.15) = 0.74.
⁷⁸⁰ Based on Dunsky and Opinion Dynamics Baseline Study results.

Iowa Energy Efficiency Statewide Technical Reference Manual-2.5.5 LED Exit Signs

is therefore assumed to be:

$$\Delta PeakTherms = \frac{\Delta Therms}{HeatDays}$$

Where:

 Δ Therms = Therm impact calculated above HeatDays = Heat season days per year = 217⁷⁸¹

For example, for a 4W, dual sided LED exit sign replacing a CFL lamp in gas heated building:

ΔPeakTherms	= -2.1/217
	= -0.0097 therms

WATER IMPACT DESCRIPTIONS AND CALCULATION

N/A

DEEMED O&M COST ADJUSTMENT CALCULATION

The annual O&M Cost Adjustment savings should be calculated using the following component costs and lifetimes.

Drogram Tuno	Component	Baseline Measure	
Program Type	Component	Cost	Life (yrs)
Retrofit/Direct	CFL lamp	\$13.00 ⁷⁸³	0.57 years ⁷⁸⁴
Install ⁷⁸²	Incandescent lamp	\$11.27 ⁷⁸⁵	0.17 years ⁷⁸⁶

MEASURE CODE: RS-LTG-EXIT-V02-180101

SUNSET DATE: 1/1/2023

⁷⁸¹ Number of days where HDD 60 >0.

⁷⁸² If program component is unknown use 70/30 split for costs and life = \$11.87 and 0.29 yrs

⁷⁸³ Consistent with assumption as listed by the U.S. Department of Energy, ENERGY STARY Life Cycle Cost Exit-Sign Calculator available at https://www.energystar.gov/index.cfm?c=exit_signs.pr_exit_signs for estimated labor cost of \$10 (assuming \$40/hour and a task time of 15 minutes). Replacement of a CFL bulb is assumed to be \$3 as noted by regional IA program details (IPL Business Assessment).

⁷⁸⁴ ENERGY STAR *"Save Energy, Money and Prevent Pollution with LED Exit Signs"* specifies that CFL bulbs for Exit Signs typically have an average rated life of 5000-6000 hours. Given 24/7 run time assume Exit Light replacement requirements as 5,500/8760.

⁷⁸⁵ Assume incandescent A-lamp 45W is \$1.27 per Itron, Ex Ante Measure cost Study, 2014 "WA017_MCS Results Matrix - Volume I (1).xlsx"

⁷⁸⁶ ENERGY STAR "Save Energy, Money and Prevent Pollution with LED Exit Signs" specifies that a typical incandescent exit sign bulb will be approx. 40W and will have a rated life of 500-2000 hours. Given 24/7 run time of the Exit Sign the replacement requirements would be an average of 1500/8766.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.5.6 LED Fixtures

2.5.6 LED Fixtures

DESCRIPTION

This characterization provides savings assumptions for LED Fixtures and is broken into four ENERGY STAR fixture types: Indoor Fixtures (including track lighting, wall-wash, sconces, ceiling and fan lights), Task and Under Cabinet Fixtures, Outdoor Fixtures (including flood light, hanging lights, security/path lights, outdoor porch lights), and Downlight Fixtures. For upstream programs, utilities should develop an assumption of the Residential v Nonresidential split and apply the relevant assumptions to each portion.

Federal legislation stemming from the Energy Independence and Security Act of 2007 (EISA) requires all generalpurpose light bulbs between 40W and 100W to be approximately 30% more energy efficient than standard incandescent bulbs. Production of 100W, standard efficacy incandescent lamps ended in 2012, followed by restrictions on 75W lamps in 2013 and 60W and 40W lamps in 2014. The baseline for this measure has therefore become fixtures with bulbs (improved incandescent or halogen) that meet the new standard. Furthermore, the Technical Advisory Committee approved assuming a blended baseline condition of EISA qualified incandescent/halogen, CFL and LED lamps. This assumption should be reviewed during each update cycle and when the net to gross impacts for this measure are determined.

Most of the lamp types in this measure are considered specialty so the same blended baseline of incandescent/halogen, and LED lamps is applied. This assumption should be reviewed during each update cycle and when the net to gross impacts for this measure are determined.

In December 2019, DOE issued a final determination for General Service Incandescent Lamps (GSILs), finding that the more stringent standards (45 lumen per watt) prescribed in the 2007 EISA regulation to become effective in 2020 (known as the 'Backstop' provision), was not economically justified. However, natural growth of LED market share has, and will continue to grow over the lifetime of the measure, and since baseline halogens would need to be replaced multiple times within the life of the measure, a single mid-life adjustment is calculated that results in an equivalent net present value of lifetime savings as the forecasted decline in annual savings.

This measure was developed to be applicable to the following program types: TOS, NC, RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

In order for this characterization to apply, new fixtures must be ENERGY STAR labeled based upon the v2.1 ENERGY STAR specification for luminaires

(<u>https://www.energystar.gov/sites/default/files/Luminaires%20V2.1%20Spec%20Final%20with%20Partner%20Commitments.pdf</u>). Specifications are as follows:

Fixture Category	Lumens/Watt
Indoor	65
Task and Under Cabinet	50
Outdoor	60
Downlight	55

DEFINITION OF BASELINE EQUIPMENT

The baseline condition for this measure is assumed to be a blend of 46% of the average EISA-equivalent wattages for the ENERGY STAR-qualified products, and 54% baseline LED.⁷⁸⁷ Baseline LED lumens/watt are estimated below:⁷⁸⁸

 ⁷⁸⁷ Consistent with assumptions for specialty lamps, based on review of CREED LightTracker data and DOE, 2019 'Energy Savings Forecast of Solid-State Lighting in General Illumination Applications'. See 'Lighting Forecast Workbook.xls'.
 ⁷⁸⁸ Estimated by applying the ratio from the relevant specialty lamp measures with the ESTAR efficacy for each fixture type.

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.5.6 LED Fixtures

Fixture Category	2021 Lumens/Watt
LED ENERGY STAR Indoor Fixture	55
LED ENERGY STAR Task /Under Cabinet	
Fixture	42
LED ENERGY STAR Outdoor Fixture	51
LED ENERGY STAR Downlight Fixture	47

The baseline is forecasted to continue to shift towards LEDs and therefore a mid-life adjustment is provided.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The lifetime of a fixture is a function of its rated life and average hours of use. The rated life is 48,000 hours for indoor and downlight, 44,000 for task and cabinet, and 49,000 for outdoor fixtures.⁷⁸⁹ This would imply a lifetime of 52 years for indoor and downlight, 60 years for task and under cabinet, and 20 years for outdoor fixtures. However, all installations are capped at 15 years,⁷⁹⁰ so a 15 year measure life should be assumed.

DEEMED MEASURE COST

Wherever possible, actual incremental costs should be used. If unavailable, assume the following incremental costs:

Fixture Category	Incremental Cost
Indoor	\$26 ⁷⁹¹
Task /Under Cabinet	\$18 ⁷⁹²
Outdoor	\$26
Downlight	\$13

LOADSHAPE

Loadshape RE09 – Residential Indoor Lighting

Loadshape RE10 – Residential Outdoor Lighting

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

 $\Delta kWh = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * (WHFeHeat + (WHFeCool - 1))$

Where:

WattsBase

= Baseline is an average of lumen-equivalent EISA wattages for ENERGY STAR products within the fixture category;⁷⁹³ see table below

⁷⁸⁹ Average rated lives are based on the average rated lives of fixtures available on the ENERGY STAR qualifying list as of 4/3/2020.

⁷⁹⁰ Based on recommendation in the Dunsky Energy Consulting, Livingston Energy Innovations and Opinion Dynamics Corporation; NEEP Emerging Technology Research Report, p 6-18.

⁷⁹¹ Incremental costs for indoor and outdoor fixtures based on ENERGY STAR Light Fixtures and Ceiling Fans Calculator, which cites "EPA research on available products, 2012." ENERGY STAR cost assumptions were reduced by 20% to account for falling LED prices.

⁷⁹² Incremental costs for task/under cabinet and downlight fixtures are from the 2018 Michigan Energy Measures Database.

⁷⁹³ See "Analysis" tab within file Residential LED Fixtures_Analysis_2020.xlsx for baseline calculations.

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.5.6 LED Fixtures

= Actual wattage of LED fixture purchased / installed – If unknown, use default provided P^{94}

Fixture Category	Watts _{Base}	Wattsee	
Indoor	62.5	23.9	
Task /Under Cabinet	48.0	11.5	
Outdoor	60.1	19.0	
Downlight	56.4	18.4	

ISR

= In Service Rate, the percentage of units rebated that are actually in service

= 1.0⁷⁹⁵

Hours

= Average hours of use per year

Fixture Category	Hours
Residential and Downlight	926 ⁷⁹⁶
Task/Under Cabinet	730 ⁷⁹⁷
Outdoor	2,475 ⁷⁹⁸

WHFe_{Heat} = Waste Heat Factor for energy to account for electric heating increase from reducing waste heat from efficient lighting (if fossil fuel heating – see calculation of heating penalty in that section).

= $1 - ((HF / \eta Heat) * \% ElecHeat)$

If unknown assume 0.93⁷⁹⁹

Where:

HF = Heating Factor or percentage of light savings that must now be heated

= 53% for interior⁸⁰⁰

= 0% for exterior or unheated location

ηHeat_{Electric} = Efficiency in COP of Heating equipment

= Actual system efficiency including duct loss – If not available, use:⁸⁰¹

⁷⁹⁴ Average of ENERGY STAR product category watts for products at or above the version 2.1 efficacy specification, and weighted average baseline of halogen and baseline LED. The ENERGY STAR QPL was accessed on 04/03/2020. See "Residential LED Fixture Analysis_2020.xls".

⁷⁹⁵ ISR recommendation for fixtures in the Dunsky Energy Consulting, Livingston Energy Innovations and Opinion Dynamics Corporation; NEEP Emerging Technology Research Report, p 6-22.

⁷⁹⁶ Assuming 365.25 days/year and average of recommended values for standard LED lamps (1088) and specialty LED lamps (763) in interior locations from Opinion Dynamics "Illinois Statewide Residential LED Hours of Use Study Additional Results," April 17, 2018.

⁷⁹⁷ Task/under cabinet hours of use are estimated at 2 hours per day.

 ⁷⁹⁸ Based on secondary research conducted as part of the Illinois PY5/PY6 ComEd Residential Lighting Program evaluation.
 ⁷⁹⁹ Calculated using defaults; 1-((0.53/1.27) * 0.17) = 0.93.

⁸⁰⁰ This means that heating loads increase by 53% of the lighting savings. This is based on the average result from REMRate modeling of several different building configurations in Des Moines, Mason City, and Burlington, IA.

⁸⁰¹ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Heat Pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.5.6 LED Fixtures

System Type	Age of Equipment	HSPF Estimate	ηHeat (Effective COP Estimate) (HSPF/3.412)*0.85
	Before 2006	6.8	1.7
Heat Pump	2006 - 2014	7.7	1.92
	2015 on	8.2	2.04
Resistance	N/A	N/A	1
Unknown	N/A	N/A	1.27 ⁸⁰²

Heating fuel	%ElecHeat
Electric	100%
Fossil Fuel	0%
Unknown	17% ⁸⁰³

WHFecool

= Waste Heat Factor for energy to account for cooling savings from reducing waste heat from efficient lighting.

Fixture Location	WHFecool
Building with cooling	1.12 ⁸⁰⁴
Building without cooling or exterior	1.0
Unknown	1.11 ⁸⁰⁵

Mid-Life Baseline Adjustment

During the lifetime of an LED fixture, baseline incandescent/halogen lamps would need to be replaced multiple times. The market share of LED replacement lamps will continue to grow over the lifetime of the measure, and since baseline halogens would need to be replaced multiple times within the life of the measure, a single mid-life adjustment is calculated that results in an equivalent net present value of lifetime savings as the forecasted decline in annual savings. See 'Residential LED Fixture Analysis_2020.xls' for details.This reduced annual savings will need to be incorporated in to cost effectiveness screening calculations. The baseline adjustment also impacts the O&M schedule.

The calculated mid-life adjustments are provided below for each fixture type:

Fixture Category	Year on adjustment is applied	Adjustment
Indoor	5	69%
Task /Under Cabinet	5	59%
Outdoor	5	67%

 ⁸⁰² Calculation assumes 33% Heat Pump and 67% Resistance, which is based upon data from Energy Information
 Administration, 2009 Residential Energy Consumption Survey, see "HC6.9 Space Heating in Midwest Region.xls". Average efficiency of heat pump is based on the assumption that 50% are units from before 2006 and 50% 2006-2014.
 ⁸⁰³ Based on Dunsky and Opinion Dynamics Baseline Study results.

⁸⁰⁴ The value is estimated at 1.12 (calculated as 1 + (0.34 / 2.8)). Based on cooling loads decreasing by 34% of the lighting savings (average result from REMRate modeling of several different building configurations in Des Moines, Mason City, and Burlington), assuming typical cooling system operating efficiency of 2.8 COP (starting from standard assumption of SEER 10.5 central AC unit, converted to 9.5 EER using algorithm (-0.02 * SEER²) + (1.12 * SEER) (from Wassmer, M. (2003); A Component-Based Model for Residential Air Conditioner and Heat Pump Energy Calculations. Master's Thesis, University of Colorado at Boulder), converted to COP = EER/3.412 = 2.8COP).

⁸⁰⁵ The value is estimated at 1.11 (calculated as 1 + (0.88*(0.34 / 2.8)). Based on assumption that 88% of homes have central cooling (based on Dunsky and Opinion Dynamics Baseline Study results).

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.5.6 LED Fixtures

Fixture Category	Year on adjustment is applied	Adjustment
Downlight	5	64%

For example, for an indoor LED fixture installed in 2021, the full savings (as calculated above in the Algorithm) should be claimed for the first four years, but a reduced annual savings (calculated energy savings above multiplied by the adjustment factor in the table above) claimed for the remainder of the measure life.

For example, an indoor LED fixture is purchased through retail in 2021: $\Delta kWh = ((62.5 - 23.9) / 1000) * 1.0 * 926 * (0.93 + (1.11 - 1))$ = 37.2 kWh

This value should be claimed for four years, but from 2025 until the end of the measure life for that same fixture, savings should be reduced to (37.2 * 0.69) = 25.7 kWh for the remainder of the measure life. Note these adjustments should be applied to kW and fuel impacts as well.

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * WHFdCool * CF$$

Where:

WHFdCool

ol = Waste Heat Factor for demand to account for cooling savings from efficient lighting.

Fixture Location	WHFdCool
Building with cooling	1.22 ⁸⁰⁶
Building without cooling or exterior	1.0
Unknown (e.g. Retail and Upstream)	1.19 ⁸⁰⁷

CF

= Summer peak Coincidence Factor for measure.

Fixture Location	CF
Residential Interior and in-unit Multifamily ⁸⁰⁸	13.1%
Exterior ⁸⁰⁹	1.8%

Other factors as defined above

For example, for an indoor LED fixture purchased through retail in 2019: $\Delta kW = ((62.5 - 23.9) / 1000) * 1.0 * 1.19 * 0.131$ = 0.0060 kW

 $^{^{806}}$ The value is estimated at 1.22 (calculated as 1 + (0.61 / 2.8)). See footnote relating to WHFe for details. Note the 61% factor represents the Residential cooling coincidence factor calculated using the average load during the peak period (as opposed to the peak hour) consistent with the lighting peak hours.

⁸⁰⁷ The value is estimated at 1.19 (calculated as 1 + (0.88 * 0.61 / 2.8)).

⁸⁰⁸ Based on analysis of loadshape data provided by Cadmus.

⁸⁰⁹ Based on Itron eShapes lighting loadprofiles.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.5.6 LED Fixtures

NATURAL GAS SAVINGS

Heating Penalty for Natural Gas heated homes:⁸¹⁰

$$\Delta Therms = -\frac{\frac{Watts_{Base} - Watts_{EE}}{1,000} * ISR * Hours * HF * 0.03412}{\eta \text{Heat}} * \% \text{GasHeat}$$

Where:

HF	= Heating Factor or percen	tage of light savings that mu	st now be heated
	= 53% for interior ⁸¹¹		
	= 0% for exterior or unheat	ed location	
0.03412	=Converts kWh to Therms		
$\eta Heat_{Gas}$	= Efficiency of heating syst	em	
	=74% ⁸¹²		
%GasHeat	= Percentage of homes wit	h gas heat	
	Heating fuel	%GasHeat	
	Electric	0%	
	Gas	100%	
	Unknown	83% ⁸¹³	

For example, for an indoor LED fixture purchased through retail in 2019:		
ΔTherms	= - ((((62.5 – 23.9) / 1000) * 1.0 * 926 * 0.53 * 0.03412) / 0.74) * 0.83	
	= - 0.72 therms	

PEAK GAS SAVINGS

For ease of application, savings for this measure is assumed to be evenly spread across the year. The Peak Gas Savings is therefore assumed to be:

$$\Delta PeakTherms = \frac{\Delta Therms}{HeatDays}$$

Where:

ΔTherms	= Therm impact calculated above
HeatDays	= Heat season days per year

⁸¹⁰ Negative value because this is an increase in heating consumption due to the efficient lighting.

⁸¹¹ This means that heating loads increase by 53% of the lighting savings. This is based on the average result from REMRate modeling of several different building configurations in Des Moines, Mason City, and Burlington, IA.

⁸¹² This has been estimated assuming that natural gas central furnace heating is typical for lowa residences (the predominant heating is gas furnace with 49% of Iowa homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey)). In 2000, 60% of furnaces purchased in Iowa were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.60*0.92) + (0.40*0.8))*(1-0.15) = 0.74.

⁸¹³ Based on Dunsky and Opinion Dynamics Baseline Study results

Iowa Energy Efficiency Statewide Technical Reference Manual—2.5.6 LED Fixtures

= 217⁸¹⁴

For example, for an indoor LED fixture purchased through retail in 2019: $\Delta PeakTherms = -0.72/217$ = -0.0033 therms

WATER IMPACT DESCRIPTIONS AND CALCULATION

N/A

DEEMED O&M COST ADJUSTMENT CALCULATION

In order to account for the shift in baseline due to the natural growth of LED over the lifetime of the measure, an annual levelized baseline replacement cost over the lifetime of the LED bulb is calculated. Bulb replacement costs assumed in the O&M calculations are provided below.⁸¹⁵

Lamp Type	Product Type	Cost
Specialty	Inc/Hal	\$3.00
	LED	\$8.69
Directional	Inc/Hal	\$5.00
	LED	\$7.80

The present value of replacement lamps and annual levelized replacement costs using the statewide real discount rate of 7.20% are presented below:⁸¹⁶

Fixture Type	PV of replacement costs for period 2021 Installs	Levelized annual replacement cost savings 2021 Installs
Indoor	\$8.89	\$1.28
Task /Under Cabinet	\$8.89	\$1.28
Outdoor	\$17.88	\$2.57
Downlight	\$13.91	\$2.00

MEASURE CODE: RS-LTG-LDFX-V03-210101

SUNSET DATE: 1/1/2022

 $^{^{814}}$ Number of days where HDD 60 >0.

⁸¹⁵ Lamp costs are based upon WECC review of bulbs purchased through the Alliant program January – April 2017 and equivalent baseline bulbs.

⁸¹⁶ See "Residential LED Fixtures_Analysis_2020.xlsx" for more information.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.1 Infiltration Control

2.6 Shell

2.6.1 Infiltration Control

DESCRIPTION

Thermal shell air leaks are sealed through strategic use and location of air-tight materials. An estimate of savings is provided in two ways. It is highly recommended that leaks be detected and pre- and post-sealing leakage rates measured with the assistance of a blower-door by qualified/certified inspectors.⁸¹⁷ Where this occurs, an algorithm is provided to estimate the site specific savings. Where test in/test out has not occurred, a conservative deemed assumption is provided.

If sealing of ducts is unknown, the sealed efficiency should be used.

This measure was developed to be applicable to the following program types: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

Air sealing materials and diagnostic testing should meet all eligibility program qualification criteria. The initial and final tested leakage rates should be assessed in such a manner that the identified reductions can be properly discerned, particularly in situations wherein multiple building envelope measures may be implemented simultaneously.

DEFINITION OF BASELINE EQUIPMENT

The existing air leakage should be determined through approved and appropriate test methods using a blower door. The baseline condition of a building upon first inspection significantly affects the opportunity for cost-effective energy savings through air sealing.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 15 years.⁸¹⁸

DEEMED MEASURE COST

The actual capital cost for this measure should be used.

Zone 6 (Mason City)	32.5	28.8	26.4	23.4
Average/ unknown	34.3	30.4	27.9	24.7

60 * 24 = Converts Cubic Feet per Minute to Cubic Feet per Day

CDD

= Cooling Degree Days

= Dependent on location:⁸²¹

Climate Zone (City based upon)	CDD 65
Zone 5 (Burlington)	1,209
Zone 6 (Mason City)	616
Average/ unknown	1,068

⁸¹⁹ Because the pre- and post-sealing blower door test will occur on different days, there is a potential for the wind and temperature conditions on the two days to affect the readings. There are methodologies to account for these effects. For wind - first if possible, avoid testing in high wind, place blower door on downwind side, take a pre-test baseline house pressure reading and adjust your house pressure readings by subtracting the baseline reading, and use the time averaging feature on the digital gauge, etc. Corrections for air density due to temperature swings can be accounted for with Air Density Correction Factors. Refer to the Energy Conservatory Blower Door Manual for more information.

⁸²⁰ N-factor is used to convert 50-pascal blower door air flows to natural air flows and is dependent on geographic location and # of stories. These were developed by applying the LBNL infiltration model (see LBNL paper 21040, *Exegisis of Proposed ASHRAE Standard 119: Air Leakage Performance for Detached Single-Family Residential Buildings*; Sherman, 1986; page v-vi, Appendix page 7-9) to the reported wind speeds and outdoor temperatures provided by the NRDC 30 year climate normals. For more information see Bruce Harley, CLEAResult "Infiltration Factor Calculations Methodology.doc" and calculation worksheets on the SharePoint site.

⁸²¹ National Climatic Data Center, calculated from 1981-2010 climate normals with a base temperature of 65°F.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.1 Infiltration Control

DUA	= Discretionary Use Adjustment (reflects the fact that people do not always operate their AC when conditions may call for it)
	= 0.75 ⁸²²
0.018	= Specific Heat Capacity of Air (Btu/ft ³ *°F)
1000	= Converts Btu to kBtu
ηCool	= Efficiency (SEER) of Air Conditioning equipment (kBtu/kWh)

= Actual (where it is possible to measure or reasonably estimate) – If unknown, assume the following:⁸²³

Age of Equipment	SEER Sealed Estimate	SEER Unsealed Estimate (SEER Sealed * 0.85)
Before 2006	10	8.5
2006 – 2014	13	11
Central AC After 1/1/2015	13	11
Heat Pump After 1/1/2015	14	12

LM

= Latent multiplier to account for latent cooling demand

= dependent on location: 824

Climate Zone (City based upon)	LM
Zone 5 (Burlington)	4.1
Zone 6 (Mason City)	4.2
Average/ unknown	4.2

ΔkWh_heating = If electric heat (resistance or heat pump), reduction in annual electric heating due to air sealing

$$=\frac{\frac{(CFM50_{Pre} - CFM50_{Post})}{N_{heat}} * 60 * 24 * HDD * 0.018}{(\eta Heat * 3,412)}$$

N heat

eat = Conversion factor from leakage at 50 Pascal to leakage at natural conditions

= Based on location and building height:⁸²⁵

⁸²² This factor's source: Energy Center of Wisconsin, May 2008 metering study; "Central Air Conditioning in Wisconsin, A Compilation of Recent Field Research", p31.

⁸²³ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Central AC was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time mean that using the minimum standard is appropriate.

⁸²⁴ The Latent Multiplier is used to convert the sensible cooling savings calculated to a value representing sensible and latent cooling loads. The values are derived from the methodology outlined in Infiltration Factor Calculation Methodology by Bruce Harley, Senior Manager, Applied Building Science, CLEAResult 11/18/2015 and is based upon an 8760 analysis of sensible and total heat loads using hourly climate data.

⁸²⁵ N-factor is used to convert 50-pascal blower door air flows to natural air flows and is dependent on geographic location and # of stories. These were developed by applying the LBNL infiltration model (see LBNL paper 21040, *Exegisis of Proposed ASHRAE Standard 119: Air Leakage Performance for Detached Single-Family Residential Buildings*; Sherman, 1986; page v-vi, Appendix page 7-9) to the reported wind speeds and outdoor temperatures provided by the NRDC 30 year climate normals. For more information see Bruce Harley, CLEAResult "Infiltration Factor Calculations Methodology.doc" and calculation worksheets on the SharePoint site.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.1 Infiltration Control

Climate Zone	N_heat (by # of stories)			
(City based upon)	1	1.5	2	3
Zone 5 (Burlington)	23.5	20.8	19.1	16.9
Zone 6 (Mason City)	21.0	18.6	17.0	15.1
Average/ unknown	22.2	19.7	18.0	16.0

HDD

= Heating Degree Days

= Dependent on location:⁸²⁶

Climate Zone (City based upon)	HDD 60
Zone 5 (Burlington)	4,496
Zone 6 (Mason City)	6,391
Average/ unknown	5,052

nHeat = Efficiency of heating system

= Actual – If not available refer to default table below:⁸²⁷

System Type	Age of Equipment	HSPF Estimate	ηHeat (Effective COP Estimate) with unsealed ducts (HSPF/3.412)*0.85	nHeat (Effective COP Estimate) with Sealed Ducts (HSPF/3.412)
	Before 2006	6.8	1.69	1.99
Heat Pump	2006 - 2014	7.7	1.92	2.26
	2015 and after	8.2	2.04	2.40
Resistance	N/A	N/A	1.00	1.00

^{3412 =} Converts Btu to kWh

For example, for a 2 story single family home in unknown location with 10.5 SEER central cooling and a heat pump with COP of 2 (1.92 including distribution losses), with pre- and post-sealing blower door test results of 3,400 and 2,250:

 $\Delta kWh = \Delta kWh_cooling + \Delta kWh_heating$ = [(((3,400 - 2,250) / 27.9) * 60 * 24 * 1068 * 0.75 * 0.018 * 6.2) / (1000 * 10.5)] +[(((3,400 - 2,250) / 18.0) * 60 * 24 * 5092 * 0.018) / (1.92 * 3,412)]= 505.3 + 1287.2= 1,792.5 kWh

Conservative Deemed Approach

⁸²⁶ National Climatic Data Center, calculated from 1981-2010 climate normals with a base temp of 60°F, consistent with the findings of Belzer and Cort, Pacific Northwest National Laboratory in "Statistical Analysis of Historical State-Level Residential Energy Consumption Trends," 2004.

⁸²⁷ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Heat Pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.1 Infiltration Control

$$\Delta kWh = SavingsPerUnit * SqFt$$

Where:

SavingsPerUnit	
Juvingsi ci onit	

= Annual savings per square foot, dependent on heating / cooling equipment⁸²⁸

Building Type	HVAC System	SavingsPerUnit (kWh/ft)
Manufactured	Central Air Conditioner	0.062
Multifamily	Central Air Conditioner	0.043
Single Family	Central Air Conditioner	0.050
Manufactured	Electric Furnace/Resistance Space Heat	0.413
Multifamily	Electric Furnace/Resistance Space Heat	0.285
Single Family	Electric Furnace/Resistance Space Heat	0.308
Manufactured	Air Source Heat Pump	0.391
Multifamily	Air Source Heat Pump	0.251
Single Family	Air Source Heat Pump	0.308
Manufactured	Air Source Heat Pump – Cooling	0.062
Multifamily	Air Source Heat Pump – Cooling	0.043
Single Family	Air Source Heat Pump – Cooling	0.050
Manufactured	Air Source Heat Pump – Heating	0.329
Multifamily	Air Source Heat Pump – Heating	0.208
Single Family	Air Source Heat Pump – Heating	0.257

SqFt

= Building conditioned square footage

= Actual

= 105 kWh

Additional Fan savings

	Δ kWh_heating	= If gas <i>furnace</i> heat, kWh savings for reduction in fan run time
		= Δ Therms * F _e * 29.3
	Fe	= Furnace Fan energy consumption as a percentage of annual fuel consumption
		= 3.14% ⁸²⁹
	29.3	= kWh per therm
	and post-sealing b	e family home in unknown location with a gas furnace with system efficiency of plower door test results of 3,400 and 2,250 (see therm calculation in Natural Gas
ΔkWh	= 114	* 0.0314 * 29.3

⁸²⁸ The values in the table represent estimates of savings from a 15% improvement in air leakage. The values are half those provided by Cadmus for the Joint Assessment, based on building simulations performed. While 30% savings are certainly achievable, this represents a thorough job in both the attic and basements and could not be verified without testing. The conservative 15% estimate is more appropriate for a deemed estimate. These values should be re-evaluated if EM&V values provide support for a higher deemed estimate.

⁸²⁹ F_e is not one of the AHRI certified ratings provided for residential furnaces, but can be reasonably estimated from a calculation based on the certified values for fuel energy (Ef in MMBtu/yr) and Eae (kWh/yr). An average of a 300 record sample (non-random) out of 1495 was 3.14%. This is, appropriately, ~50% greater than the ENERGY STAR version 3 criteria for 2% Fe. See "Furnace Fan Analysis.xlsx" for reference.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.1 Infiltration Control

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \frac{\Delta kWh_cooling}{FLH_cooling} * CF$$

Where:

FLH_cooling

= Full load hours of air conditioning

= Dependent on location:⁸³⁰

Climate Zone (City based upon)	Single Family	Multifamily	Manufactured
Zone 5 (Burlington)	918	736	865
Zone 6 (Mason City)	468	375	441
Average/ unknown	811	650	764

CF

= Summer System Peak Coincidence Factor for Cooling

= 68% if central AC; 72% if ducted ASHP or ductless HP used for whole home conditioning;⁸³¹ 43.1% for ductless HP used as supplemental or limited zone⁸³²

For example, for a 2 story single family home in unknown location with 10.5 SEER central cooling and a heat pump with COP of 2.0, with pre- and post-sealing blower door test results of 3,400 and 2,250:

ΔkW = 505.3 / 811 * 0.68 = 0.42 kW

NATURAL GAS SAVINGS

Test In / Test Out Approach

If Natural Gas heating:

$$\Delta Therms = \frac{\frac{(CFM50_{Pre} - CFM50_{Post})}{N_{heat}} * 60 * 24 * HDD * 0.018}{(\eta Heat * 100,000)}$$

Where:

N_heat

= Conversion factor from leakage at 50 Pascal to leakage at natural conditions

= Based on location and building height:⁸³³

Climate Zone	N_heat (by # of stories)			
(City based upon)	1	1.5	2	3
Zone 5 (Burlington)	23.5	20.8	19.1	16.9

⁸³⁰ Full load hours for Des Moines are provided based on Cadmus modeling for the 2011 Joint Assessment. The other locations were calculated based on relative Cooling Degree Day ratios (from NCDC).

⁸³¹ Based on analysis of metering results from homes in Ameren Illinois service territory in PY5; 'Impact and Process Evaluation of Ameren Illinois Company's Residential HVAC Program (PY5)'.

⁸³² Based on analysis of metering results from Ameren Illinois; Cadmus, "All-Electric Homes: PY6 Metering Results: Multifamily HVAC Systems", October 6, 2015.

⁸³³ N-factor is used to convert 50-pascal blower door air flows to natural air flows and is dependent on geographic location and # of stories. These were developed by applying the LBNL infiltration model (see LBNL paper 21040, *Exegisis of Proposed ASHRAE Standard 119: Air Leakage Performance for Detached Single-Family Residential Buildings*; Sherman, 1986; page v-vi, Appendix page 7-9) to the reported wind speeds and outdoor temperatures provided by the NRDC 30 year climate normals. For more information see Bruce Harley, CLEAResult "Infiltration Factor Calculations Methodology.doc" and calculation worksheets on the SharePoint site.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.1 Infiltration Control

Climate Zone	N_heat (by # of stories))
(City based upon)	1	1.5	2	3
Zone 6 (Mason City)	21.0	18.6	17.0	15.1
Average/ unknown	22.2	19.7	18.0	16.0

HDD

= Heating Degree Days

= Dependent on location:⁸³⁴

Climate Zone (City based upon)	HDD 60
Zone 5 (Burlington)	4,496
Zone 6 (Mason City)	6,391
Average/ unknown	5,052

ηHeat

= Efficiency of heating system

= Equipment efficiency * distribution efficiency

= Actual⁸³⁵ – If not available, use 74% for unsealed ducts⁸³⁶ or 87% for sealed ducts

Other factors as defined above.

For example, for 2 story single family home in unknown location with a gas furnace with system efficiency of 70%, with pre- and post-sealing blower door test results of 3,400 and 2,250:

 Δ Therms = (((3,400 - 2,250)/18.0) * 60 * 24 * 5052 * 0.018) / (0.74 * 100,000) = 113.1 therms

Conservative Deemed Approach

 $\Delta Therms = SavingsPerUnit * SqFt$

Where:

SavingsPerUnit

= Annual savings per square foot, dependent on heating / cooling equipment⁸³⁷

⁸³⁴ National Climatic Data Center, calculated from 1981-2010 climate normals with a base temp of 60°F, consistent with the findings of Belzer and Cort, Pacific Northwest National Laboratory in "Statistical Analysis of Historical State-Level Residential Energy Consumption Trends," 2004.

⁸³⁵ Ideally, the System Efficiency should be obtained either by recording the AFUE of the unit, or performing a steady state efficiency test. The Distribution Efficiency can be estimated via a visual inspection and by referring to a look up table such as that provided by the Building Performance Institute: (<u>http://www.bpi.org/files/pdf/DistributionEfficiencyTable-BlueSheet.pdf</u> or by performing duct blaster testing.

⁸³⁶ This has been estimated assuming that natural gas central furnace heating is typical for Iowa residences (the predominant heating is gas furnace with 49% of Iowa homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey). In 2000, 60% of furnaces purchased in Iowa were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.60*0.92) + (0.40*0.8)) * (1-0.15) = 0.74.

⁸³⁷ The values in the table represent estimates of savings from a 15% improvement in air leakage. The values are half those provided by Cadmus for the Joint Assessment, based on building simulations performed. While 30% savings are certainly achievable, this represents a thorough job in both the attic and basements and could not be verified without testing. The conservative 15% estimate is more appropriate for a deemed estimate. These values should be re-evaluated if EM&V values provide support for a higher deemed estimate.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.1 Infiltration Control

Building Type	HVAC System	SavingsPerUnit (Therms/ft)
Manufactured	Gas Boiler	0.022
Multifamily	Gas Boiler	0.018
Single Family	Gas Boiler	0.016
Manufactured	Gas Furnace	0.017
Multifamily	Gas Furnace	0.012
Single Family	Gas Furnace	0.013

SqFt

= Building square footage

= Actual

PEAK GAS SAVINGS

 $\Delta PeakTherms = \Delta Therms * GCF$

Where:

ΔTherms	= Therm impact calculated above
GCF	= Gas Coincidence Factor for Heating ⁸³⁸
	= 0.014378 for Residential Boiler
	= 0.016525 for Residential Space Heating (other)

For example, for a 2 story single family home in Chicago with a gas furnace with system efficiency of 70%, with pre- and post-sealing blower door test results of 3,400 and 2,250:

ΔPeakTherms = 113.1 * 0.016525

= 1.87 therms

Conservative Deemed Approach

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.2 Attic/Ceiling Insulation

2.6.2 Attic/Ceiling Insulation

DESCRIPTION

This measure describes savings from adding insulation to the attic/ceiling. This measure requires a member of the implementation staff evaluating the pre- and post-project R-values and to measure surface areas. The efficiency of the heating and cooling equipment in the home should also be evaluated if possible. If sealing of ducts is unknown, the sealed efficiency should be used.

This measure was developed to be applicable to the following program types: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The requirements for participation in the program will be defined by the utilities.

DEFINITION OF BASELINE EQUIPMENT

The existing condition will be evaluated by implementation staff or a participating contractor.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 25 years.⁸³⁹

DEEMED MEASURE COST

The actual installed cost for this measure should be used in screening.

LOADSHAPE

DUA	= Discretionary Use Adjust AC when conditions may c		t that p	eople do not alw	ays operate their
	= 0.75 ⁸⁴⁴				
1000	= Converts Btu to kBtu				
ηCool	= Seasonal Energy Efficien	cy Ratio of cooling sys	tem (kE	Btu/kWh)	
	= Actual (where it is possi the following: ⁸⁴⁵	ble to measure or rea	sonably	y estimate) – If u	nknown, assume
	Age of Equipment	ηCool Sealed Duct	Du	ool Unsealed uct Estimate	

Age of Equipment	ηCool Sealed Duct Estimate	Duct Estimate (nCool Sealed * 0.85)
Before 2006	10	8.5
2006 – 2014	13	11
Central AC after 1/1/2015	13	11
Heat Pump after 1/1/2015	14	12

⁸⁴⁰ If open cavity, add new insulation value to the default or evaluated existing assembly R-value (R_{old}). If closed cavity, since you are displacing one or two air layers, reduce the default or evaluated existing assembly R-value by one and add to new insulation. Note, if existing insulation is added to/not removed – always re-evaluate R-value of existing insulation as it may have been degraded significantly due to compression etc.

⁸⁴¹ An estimate based on review of Madison Gas and Electric, Exterior Wall Insulation, R-value for no insulation in walls, and NREL's Building Energy Simulation Test for Existing Homes (BESTEST-EX).

 ⁸⁴² ASHRAE, 2001, "Characterization of Framing Factors for New Low-Rise Residential Building Envelopes (904-RP)," Table 7.1
 ⁸⁴³ National Climatic Data Center, calculated from 1981-2010 climate normals with a base temp of 65°F.

⁸⁴⁴ This factor's source: Energy Center of Wisconsin, May 2008 metering study; "Central Air Conditioning in Wisconsin, A Compilation of Recent Field Research", p31.

⁸⁴⁵ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Central AC was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time mean that using the minimum standard is appropriate.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.2 Attic/Ceiling Insulation

kWh_heating = If electric heat (resistance or heat pump), reduction in annual electric heating due to insulation

$$=\frac{\left(\frac{1}{R_{old}}-\frac{1}{R_{Attic}}\right)*A_{Attic}*(1-FramingFactor_{Attic})*HDD*24}{(\eta Heat * 3412)}$$

HDD

= Heating Degree Days

= Dependent on location:⁸⁴⁶

Climate Zone (City based upon)	HDD 60
Zone 5 (Burlington)	4,496
Zone 6 (Mason City)	6,391
Average/ unknown	5,052

ηHeat = Efficiency of heating system

= Actual – If not available, refer to default table below:⁸⁴⁷

System Type	Age of Equipment	HSPF Estimate	ηHeat (Effective COP Estimate) with unsealed ducts (HSPF/3.412)*0.85	nHeat (Effective COP Estimate) with Sealed Ducts (HSPF/3.412)
	Before 2006	6.8	1.69	1.99
Heat Pump	2006 - 2014	7.7	1.92	2.26
	2015 and after	8.2	2.04	2.40
Resistance	N/A	N/A	1.00	1.00

^{3412 =} Converts Btu to kWh

For example, for a single family home in Mason City with 700 ft² of R-5 attic insulated to R-49, 10.5 SEER Central AC, and 2.26 (1.92 including distribution losses) COP Heat Pump: $\Delta kWh = (\Delta kWh_cooling + \Delta kWh_heating)$ = (((1/5 - 1/49) * 700 * (1-0.07) * 616 * 24 * 0.75)/ (1000 * 10.5)) + (((1/5 - 1/49) * 700 * (1-0.07) * 6391 * 24) / (1.92 * 3412))= 123 + 2737= 2860 kWh

 $\Delta kWh_heating = If gas furnace heat, kWh savings for reduction in fan run time$

= ΔTherms * Fe * 29.3

⁸⁴⁶ National Climatic Data Center, calculated from 1981-2010 climate normals with a base temp of 60°F, consistent with the findings of Belzer and Cort, Pacific Northwest National Laboratory in "Statistical Analysis of Historical State-Level Residential Energy Consumption Trends," 2004.

⁸⁴⁷ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Heat Pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.2 Attic/Ceiling Insulation

Where:	
Fe	= Furnace Fan energy consumption as a percentage of annual fuel consumption
	= 3.14% ⁸⁴⁸
29.3	= kWh per therm

For example, for a single family home in Mason City with 700 ft² of R-5 attic insulated to R-49, with a gas furnace with system efficiency of 74% (for therm calculation see Natural Gas Savings section) with unsealed ducts:

ΔkWh = 179.2 * 0.0314 * 29.3

= 165 kWh

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \frac{\Delta kWh_cooling}{FLH_cooling} * CF$$

Where:

FLH_cooling = Full load hours of air conditioning

= Dependent on location:⁸⁴⁹

Climate Zone (City based upon)	Single Family	Multifamily	Manufactured
Zone 5 (Burlington)	918	736	865
Zone 6 (Mason City)	468	375	441
Average/ unknown	811	650	764

CF

= Summer System Peak Coincidence Factor for Cooling

= 68% if central AC; 72% if ducted ASHP or ductless HP used for whole home conditioning;⁸⁵⁰ 43.1% for ductless HP used as supplemental or limited zone⁸⁵¹

For example, for a single family home in Mason City with 700 ft² of R-5 attic insulated to R-49, 10.5 SEER Central AC, and 2.26 (1.92 including distribution losses) COP Heat Pump:

ΔkW = 123 / 468 * 0.68 = 0.1787 kW

NATURAL GAS SAVINGS

ΔTherms (if Natural Gas heating)

⁸⁴⁸ F_e is not one of the AHRI certified ratings provided for residential furnaces, but can be reasonably estimated from a calculation based on the certified values for fuel energy (Ef in MMBtu/yr) and Eae (kWh/yr). An average of a 300 record sample (non-random) out of 1495 was 3.14%. This is, appropriately, ~50% greater than the Energy Star version 3 criteria for 2% F_e. See "Furnace Fan Analysis.xlsx" for reference.

⁸⁴⁹ Full load hours for Des Moines are provided based on Cadmus modeling for the 2011 Joint Assessment. The other locations were calculated based on relative Cooling Degree Day ratios (from NCDC).

⁸⁵⁰ Based on analysis of metering results from homes in Ameren Illinois service territory in PY5; 'Impact and Process Evaluation of Ameren Illinois Company's Residential HVAC Program (PY5)'.

⁸⁵¹ Based on analysis of metering results from Ameren Illinois; Cadmus, "All-Electric Homes: PY6 Metering Results: Multifamily HVAC Systems", October 6, 2015.

Iowa Energy Efficiency Statewide Technical Reference Manual-2.6.2 Attic/Ceiling Insulation

$$=\frac{\left(\frac{1}{R_{old}}-\frac{1}{R_{attic}}\right)*A_{Attic}*(1-FramingFactor_{Attic})*HDD*24}{(\eta Heat*100,000)}$$

Where:

HDD

= Heating Degree Days

= Dependent on location:⁸⁵²

Climate Zone (City based upon)	HDD 60
Zone 5 (Burlington)	4,496
Zone 6 (Mason City)	6,391
Average/ unknown	5,052

ηHeat = Efficiency of heating system		
	= Equipment efficiency * distribution efficiency	
	= Actual. ⁸⁵³ If unknown, assume 74% for unsealed ducts ⁸⁵⁴ or 87% for sealed ducts.	
100,000	= Converts Btu to Therms	
Other factors as defined above		

For example, for a single family home in Mason City with 700 ft² of R-5 attic insulated to R-49, with a gas furnace with system efficiency of 87% with sealed ducts:

ΔTherms = ((1/5 - 1/49) * 700 * (1-0.07) * 6391 * 24) / (0.87 * 100,000) = 206.1therms

PEAK GAS SAVINGS

 $\Delta PeakTherms = \Delta Therms * GCF$

Where:

ΔTherms	= Therm impact calculated above
GCF	= Gas Coincidence Factor for Heating ⁸⁵⁵
	= 0.014378 for Residential Boiler
	= 0.016525 for Residential Space Heating (other)

⁸⁵² National Climatic Data Center, calculated from 1981-2010 climate normals with a base temp of 60°F, consistent with the findings of Belzer and Cort, Pacific Northwest National Laboratory in "Statistical Analysis of Historical State-Level Residential Energy Consumption Trends," 2004.

⁸⁵³ Ideally, the System Efficiency should be obtained either by recording the AFUE of the unit, or performing a steady state efficiency test. The Distribution Efficiency can be estimated via a visual inspection and by referring to a look up table such as that provided by the Building Performance Institute: (<u>http://www.bpi.org/files/pdf/DistributionEfficiencyTable-BlueSheet.pdf</u>) or by performing duct blaster testing.

⁸⁵⁴ This has been estimated assuming that natural gas central furnace heating is typical for Iowa residences (the predominant heating is gas furnace with 49% of Iowa homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey). In 2000, 60% of furnaces purchased in Iowa were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.60*0.92) + (0.40*0.8)) * (1-0.15) = 0.74.
⁸⁵⁵ Calculated using Cadmus provided Gas Loadshapes as the maximum daily load for the end use.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.2 Attic/Ceiling Insulation

For example, for a single family home in Mason City with 700 ft² of R-5 attic insulated to R-49, with a gas furnace with system efficiency of 87% with sealed ducts: $\Delta PeakTherms = 206.1^* 0.016525$

= 3.406therms

SUNSET DATE: 1/1/2022

Iowa Energy Efficiency Statewide Technical Reference Manual-2.6.3 Rim/Band Joist Insulation

2.6.3 Rim/Band Joist Insulation

DESCRIPTION

This measure describes savings from adding insulation (either rigid or spray foam) to rim/band joist cavities. This measure requires a member of the implementation staff evaluating the pre- and post-project R-values and to measure surface areas. The efficiency of the heating and cooling equipment in the home should also be evaluated if possible.

Note unconditioned means a space that is not intentionally heated via furnace vents or boiler radiators. The presence of and/or leakage from a heating system in a space does not itself imply the space is conditioned. If sealing of ducts is unknown, the sealed efficiency should be used.

This measure was developed to be applicable to the following program types: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The requirements for participation in the program will be defined by the utilities.

DEFINITION OF BASELINE EQUIPMENT

The existing condition will be evaluated by implementation staff or a participating contractor and is likely to be an uninsulated rim/band joist.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 25 years.⁸⁵⁶

DEEMED MEASURE COST

The actual installed cost for this measure should be used in screening.

Loadshape RE07 – Residential Single Family Cooling

Loadshape RE06 – Residential Single Family Central Heat

Loadshape RE08 – Residential Single Family Heat Pump

Loadshape RG01 - Residential Boiler

Loadshape RG04 - Residential Other Heating

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

$$\Delta kWh = (\Delta kWh_cooling + \Delta kWh_heating)$$

Where

 $\Delta kWh_{cooling}$ = If central cooling, reduction in annual cooling requirement due to insulation

⁸⁵⁶ Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, 2007

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.6.3 Rim/Band Joist Insulation

_	$\left(\frac{1}{R_{old}} - \frac{1}{R_{Rim}}\right) * A_{Rim} * (1 - FramingFactor_{Rim}) * CDD * 24 * DUA$
_	(1000 * ηCool)

RRim

= R-value of new rim/band joist assembly including all layers between inside air and outside air (ft².°F.h/Btu)

= Actual⁸⁵⁷

R_{old} = R-value value of existing assembly and any existing insulation (ft².°F.h/Btu).

(Minimum of R-5 for uninsulated assemblies)⁸⁵⁸

= Net area of insulated rim/band joist (ft²)

FramingFactor_{Rim} = Adjustment to account for area of framing

= 25%⁸⁵⁹

CDD

ARim

= Cooling Degree Days

= Dependent on location and whether in conditioned or unconditioned space:

Climate Zone (City based upon)	Conditioned Space CDD 65 ⁸⁶⁰	Unconditioned Space CDD 75 ⁸⁶¹
Zone 5 (Burlington)	1,209	411
Zone 6 (Mason City)	616	264
Average/ unknown	1,068	474

DUA = Discretionary Use Adjustment (reflects the fact that people do not always operate their AC when conditions may call for it)

= 0.75 ⁸⁶²

1000 = Converts Btu to kBtu

ηCool = Seasonal Energy Efficiency Ratio of cooling system (kBtu/kWh)

⁸⁵⁷ If open cavity, add new insulation value to the default or evaluated existing assembly R-value (R_{old}). If closed cavity, since you are displacing one or two air layers, reduce the default or evaluated existing assembly R-value by one and add to new insulation. Note, if existing insulation is added to/not removed – always re-evaluate R-value of existing insulation as it may have been degraded significantly due to compression etc.

⁸⁵⁸ An estimate based on review of Madison Gas and Electric, Exterior Wall Insulation, R-value for no insulation in walls, and NREL's Building Energy Simulation Test for Existing Homes (BESTEST-EX).

⁸⁵⁹ Consistent with Wall framing factor assumption; ASHRAE, 2001, "Characterization of Framing Factors for New Low-Rise Residential Building Envelopes (904-RP)," Table 7.1.

⁸⁶⁰ National Climatic Data Center, calculated from 1981-2010 climate normals with a base temp of 65°F.

⁸⁶¹ The base temperature should be the outdoor temperature at which the desired indoor temperature stays constant, in balance with heat loss or gain to the outside and internal gains. Since unconditioned basements are allowed to swing in temperature, are ground coupled, and are usually cool, they have a bigger delta between the two (heating and cooling) base temperatures. 75F for cooling and 50F for heating are used based on professional judgment. Five year average cooling degree days with 75F base temp are provided from DegreeDays.net because the 30 year climate normals from NCDC are not available at base temps above 72F.

⁸⁶² This factor's source: Energy Center of Wisconsin, May 2008 metering study; "Central Air Conditioning in Wisconsin, A Compilation of Recent Field Research," p31.

Iowa Energy Efficiency Statewide Technical Reference Manual-2.6.3 Rim/Band Joist Insulation

= Actual (where it is possible to measure or reasonably estimate) – If unknown, assume the following:⁸⁶³

Age of Equipment	ηCool Sealed Duct Estimate	ηCool Unsealed Duct Estimate (nCool Sealed * 0.85)
Before 2006	10	8.5
2006 - 2014	13	11
Central AC after 1/1/2015	13	11
Heat Pump after 1/1/2015	14	12

kWh_heating = If electric heat (resistance or heat pump), reduction in annual electric heating due to insulation

$$=\frac{\left(\frac{1}{R_{old}}-\frac{1}{R_{Rim}}\right)*A_{Rim}*(1-FramingFactor_{Rim})*HDD*24*ADJRim}{(\eta Heat*3412)}$$

HDD

= Heating Degree Days

= Dependent on location and whether in conditioned or unconditioned space:

Climate Zone (City based upon)	Conditioned Space HDD 60 ⁸⁶⁴	Unconditioned Space HDD 50 ⁸⁶⁵
Zone 5 (Burlington)	4,496	2,678
Zone 6 (Mason City)	6,391	4,222
Average/ unknown	5,052	3,126

ηHeat

= Efficiency of heating system

= Actual – If not available, refer to default table below:⁸⁶⁶

⁸⁶³ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Central AC was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time mean that using the minimum standard is appropriate.

⁸⁶⁴ National Climatic Data Center, calculated from 1981-2010 climate normals with a base temp of 60°F, consistent with the findings of Belzer and Cort, Pacific Northwest National Laboratory in "Statistical Analysis of Historical State-Level Residential Energy Consumption Trends," 2004.

⁸⁶⁵ The base temperature should be the outdoor temperature at which the desired indoor temperature stays constant, in balance with heat loss or gain to the outside and internal gains. Since unconditioned basements are allowed to swing in temperature, are ground coupled, and are usually cool, they have a bigger delta between the two (heating and cooling) base temperatures. 75F for cooling and 50F for heating are used based on professional judgment. National Climatic Data Center, calculated from 1981-2010 climate normals.

⁸⁶⁶ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Heat Pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

Iowa Energy Efficiency Statewide Technical Reference Manual-2.6.3 Rim/Band Joist Insulation

System Type	Age of Equipment	HSPF Estimate	ηHeat (Effective COP Estimate) with unsealed ducts (HSPF/3.412)*0.85	nHeat (Effective COP Estimate) with Sealed Ducts (HSPF/3.412)
	Before 2006	6.8	1.69	1.99
Heat Pump	2006 - 2014	7.7	1.92	2.26
	2015 on	8.2	2.04	2.40
Resistance	N/A	N/A	1.00	1.00

3412 = Converts Btu to kWh

 $\mathsf{ADJ}_\mathsf{Rim}$

= Adjustment for rim/band joist insulation to account for prescriptive engineering algorithms consistently overclaiming savings.

=63%⁸⁶⁷

For example, for a single family home in Mason City with 100 ft² of uninsulated (assume R-5) rim/band joist cavities in an unconditioned basement that is insulated to R-13. The home has 10.5 SEER Central AC and 2.26 (1.92 including distribution losses) COP Heat Pump:

 $\Delta kWh = (\Delta kWh_cooling + \Delta kWh_heating)$ = (((1/5 - 1/13) * 100 * (1-0.25) * 264 * 24 * 0.75) / (1000 * 10.5)) + (((1/5 - 1/13) * 100 * (1-0.25) * 4222 * 24 * 0.63) / (1.92 * 3412)) = 4.2 + 89.9 = 94.1 kWh

For example, for a single family home in Mason City with 100 ft² of uninsulated (assume R-5) rim/band joist cavities in an unconditioned basement that is insulated to R-13. The home has a gas furnace with system efficiency of 74% (for therm calculation see Natural Gas Savings section) with unsealed ducts:

ΔkWh = 8.0 * 0.0314 * 29.3 = 7.4 kWh

⁸⁶⁷ Consistent with ADJWall; Based upon comparing algorithm derived savings estimate and evaluated bill analysis estimate in the following 2012 Massachusetts report: "Home Energy Services Impact Evaluation", August 2012. See "Insulation ADJ calculations.xls" for details or calculation.

⁸⁶⁸ F_e is not one of the AHRI certified ratings provided for residential furnaces, but can be reasonably estimated from a calculation based on the certified values for fuel energy (Ef in MMBtu/yr) and Eae (kWh/yr). An average of a 300 record sample (non-random) out of 1495 was 3.14%. This is, appropriately, ~50% greater than the Energy Star version 3 criteria for 2% F_e. See "Furnace Fan Analysis.xlsx" for reference.

Iowa Energy Efficiency Statewide Technical Reference Manual - 2.6.3 Rim/Band Joist Insulation

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \frac{\Delta kWh_cooling}{FLH_cooling} * CF$$

Where:

FLH_cooling

= Full load hours of air conditioning

= Dependent on location:⁸⁶⁹

Climate Zone (City based upon)	Single Family	Multifamily	Manufactured
Zone 5 (Burlington)	918	736	865
Zone 6 (Mason City)	468	375	441
Average/ unknown	811	650	764

CF

= Summer System Peak Coincidence Factor for Cooling

= 68% if central AC; 72% if ducted ASHP or ductless HP used for whole home conditioning;⁸⁷⁰ 43.1% for ductless HP used as supplemental or limited zone⁸⁷¹

For example, for a single family home in Mason City with 100 ft² of uninsulated (assume R-5) rim/band joist cavities in an unconditioned basement that is insulated to R-13. The home has 10.5 SEER Central AC and 2.26 (1.92 including distribution losses) COP Heat Pump:

 $\Delta kW = 4.2 / 468 * 0.68$ = 0.0061 kW

NATURAL GAS SAVINGS

ΔTherms (if Natural Gas heating)

$$=\frac{\left(\frac{1}{R_{old}}-\frac{1}{R_{Rim}}\right)*A_{Rim}*(1-FramingFactor_{Rim})*HDD*24*ADJRim}{(\eta Heat*100,000)}$$

Where:

HDD

= Heating Degree Days

= Dependent on location and whether in conditioned or unconditioned space:

Climate Zone	Conditioned Space	Unconditioned Space	
(City based upon)	HDD 60 ⁸⁷²	HDD 50 ⁸⁷³	
Zone 5 (Burlington)	4,496	2,678	

⁸⁶⁹ Full load hours for Des Moines are provided based on Cadmus modeling for the 2011 Joint Assessment. The other locations were calculated based on relative Cooling Degree Day ratios (from NCDC).

⁸⁷³ The base temperature should be the outdoor temperature at which the desired indoor temperature stays constant, in

⁸⁷⁰ Based on analysis of metering results from homes in Ameren Illinois service territory in PY5; 'Impact and Process Evaluation of Ameren Illinois Company's Residential HVAC Program (PY5)'.

⁸⁷¹ Based on analysis of metering results from Ameren Illinois; Cadmus, "All-Electric Homes: PY6 Metering Results: Multifamily HVAC Systems", October 6, 2015.

⁸⁷² National Climatic Data Center, calculated from 1981-2010 climate normals with a base temp of 60°F, consistent with the findings of Belzer and Cort, Pacific Northwest National Laboratory in "Statistical Analysis of Historical State-Level Residential Energy Consumption Trends," 2004.

Iowa Energy Efficiency Statewide Technical Reference Manual-2.6.3 Rim/Band Joist Insulation

	Climate Zone (City based upon)	Conditioned Space HDD 60 ⁸⁷²	Unconditioned Space HDD 50 ⁸⁷³	
	Zone 6 (Mason City)	6,391	4,222	
	Average/ unknown	5,052	3,126	
ηHeat	= Efficiency of heating system = Equipment efficiency * distribut = Actual. ⁸⁷⁴ If unknown, assume 7		d ducts ⁸⁷⁵ or 87%	for sealed ducts
100,000	= Converts Btu to Therms			
Oth	er factors as defined above			
example, for a	single family home in Mason City with	h 100 ft ² of uni	insulated (assume	R-5) rim/band joi

For example, for a single family home in Mason City with 100 ft² of uninsulated (assume R-5) rim/band joist cavities in an unconditioned basement that is insulated to R-13. The home has a gas furnace with system efficiency of 87% with sealed ducts:

ΔTherms = ((1/5 - 1/13) * 100 * (1-0.25) * 4222 * 24 * 0.63) / (0.87 * 100,000) = 6.8therms

PEAK GAS SAVINGS

 $\Delta PeakTherms = \Delta Therms * GCF$

Where:

ΔTherms	= Therm impact calculated above
GCF	= Gas Coincidence Factor for Heating ⁸⁷⁶
	= 0.014378 for Residential Boiler
	= 0.016525 for Residential Space Heating (other)

⁸⁷⁵ This has been estimated assuming that natural gas central furnace heating is typical for Iowa residences (the predominant heating is gas furnace with 49% of Iowa homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey). In 2000, 60% of furnaces purchased in Iowa were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment (see Furnace Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.60*0.92) + (0.40*0.8)) * (1-0.15) = 0.74.

balance with heat loss or gain to the outside and internal gains. Since unconditioned basements are allowed to swing in temperature, are ground coupled, and are usually cool, they have a bigger delta between the two (heating and cooling) base temperatures. 75F for cooling and 50F for heating are used based on professional judgment. National Climatic Data Center, calculated from 1981-2010 climate normals.

⁸⁷⁴ Ideally, the System Efficiency should be obtained either by recording the AFUE of the unit, or performing a steady state efficiency test. The Distribution Efficiency can be estimated via a visual inspection and by referring to a look up table such as that provided by the Building Performance Institute: (<u>http://www.bpi.org/files/pdf/DistributionEfficiencyTable-BlueSheet.pdf</u>) or by performing duct blaster testing.

⁸⁷⁶ Calculated using Cadmus provided Gas Loadshapes as the maximum daily load for the end use.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.3 Rim/Band Joist Insulation

For example, for a single family home in Mason City with 100 ft² of uninsulated (assume R-5) rim/band joist cavities in an unconditioned basement that is insulated to R-13. The home has a gas furnace with system efficiency of 87% with sealed ducts:

 $\Delta PeakTherms = 6.8* 0.016525$

= 0.11therms

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.4 Wall Insulation

2.6.4 Wall Insulation

DESCRIPTION

This measure describes savings from adding insulation (for example, blown cellulose, spray foam) to wall cavities. This measure requires a member of the implementation staff evaluating the pre- and post-project R-values and to measure surface areas. The efficiency of the heating and cooling equipment in the home should also be evaluated if possible. If sealing of ducts is unknown, the sealed efficiency should be used.

This measure was developed to be applicable to the following program types: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The requirements for participation in the program will be defined by the utilities.

DEFINITION OF BASELINE EQUIPMENT

The existing condition will be evaluated by implementation staff or a participating contractor and is likely to be empty wall cavities.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 25 years.⁸⁷⁷

DEEMED MEASURE COST

The actual installed cost for this measure should be used in screening.

MEASURE CODE: RS-SHL-WINS-V03-200101

SUNSET DATE: 1/1/2022

2.6.5 Insulated Doors

DESCRIPTION

Energy and demand saving are realized through reductions in the building cooling and heating loads.

If sealing of ducts is unknown, the sealed efficiency should be used.

This measure was developed to be applicable to the following program types: RF

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient condition is insulation levels that exceed code requirements and should be determined by the program.

DEFINITION OF BASELINE EQUIPMENT

The retrofit baseline condition is the existing condition and requires assessment of the existing insulation. It should be based on the entire door assembly.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The measure expected useful life (EUL) is assumed to be 25 years.⁸⁹⁴

DEEMED MEASURE COST

For retrofit projects, full installation costs should be used.

Algorithm

CALCULATION OF ENERGY SAVINGS

ELECTRIC ENERGY SAVINGS

Electric energy savings is calculated as the sum of energy saved when cooling the building and energy saved when heating the building.

$$\Delta kWh = \Delta kWh cooling + \Delta kWh heating$$

If central cooling, the electric energy saved in annual cooling due to the added insulation is

$$\Delta kWh_{cooling} = \frac{\left(\frac{1}{R_{existing}} - \frac{1}{R_{new}}\right) * Area * CDD * 24 * DUA}{(1,000 * \eta_{cooling})}$$

⁸⁹⁴ Fannie Mae Estimated useful life tables for multifamily properties.

Iowa Energy Efficiency Statewide Technical Reference Manual -2.6.5 Insulated Doors

Where:

DUA

Rexisting	= Existing door heat loss coefficient [(hr-°F-ft ²)/Btu]. If unknown, assume 3.125 ⁸⁹⁵
R _{new}	= New door heat loss coefficient [(hr- ^o F-ft ²)/Btu]
Area	= Area of the door surface in square feet.
CDD	= Cooling Degree Days

= Cooling Degree Days

= Dependent on location:896

Climate Zone (City based upon)	CDD 65
Zone 5 (Burlington)	1,209
Zone 6 (Mason City)	616
Average/ unknown	1,068

24 = Converts days to hours

> = Discretionary Use Adjustment (reflects the fact that people do not always operate their AC when conditions may call for it)

> > = 0.75⁸⁹⁷

1,000 = Conversion from Btu to kBtu

= Seasonal energy efficiency ratio (SEER) of cooling system (kBtu/kWh) ηcooling

> = Actual (where it is possible to measure or reasonably estimate) - If unknown, assume the following:898

Age of Equipment	ηCool Estimate Sealed Duct Estimate	ηCool Unsealed Duct Estimate (nCool Sealed * 0.85)
Before 2006	10	8.5
2006 – 2014	13	11
Central AC after 1/1/2015	13	11
Heat Pump after 1/1/2015	14	12

If the building is heated with electric heat (resistance or heat pump), the electric energy saved in annual heating due to the added insulation is:

$$\Delta kWh_{heating} = \frac{\left(\frac{1}{R_{existing}} - \frac{1}{R_{new}}\right) * Area * HDD * 24}{(3,412 * \eta_{heating})}$$

Where:

HDD

= Heating Degree Days

⁸⁹⁵ IECC 2012 and 2015 requirements

⁸⁹⁶ National Climatic Data Center, calculated from 1981-2010 climate normals with a base temp of 65°F.

⁸⁹⁷ This factor's source is: Energy Center of Wisconsin, May 2008 metering study; "Central Air Conditioning in Wisconsin, A Compilation of Recent Field Research", p31.

⁸⁹⁸ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Central AC was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time mean that using the minimum standard is appropriate.

= Dependent on	location: ⁸⁹⁹
----------------	--------------------------

Climate Zone (City based upon)	HDD 60
Zone 5 (Burlington)	4,496
Zone 6 (Mason City)	6,391
Average/ unknown	5,052

 η heating

= Efficiency of heating system

= Actual – If not available, refer to d	default table below: ⁹⁰⁰
---	-------------------------------------

System Type	Age of Equipment	HSPF Estimate	ηHeat (Effective COP Estimate) with unsealed ducts (HSPF/3.412)*0.85	nHeat (Effective COP Estimate) with Sealed Ducts (HSPF/3.412)
	Before 2006	6.8	1.69	1.99
Heat Pump	2006 - 2014	7.7	1.92	2.26
	2015 and after	8.2	2.04	2.40
Resistance	N/A	N/A	1.00	1.00

3,142 = Conversion from Btu to kWh.

For example, for a single family home in Mason City installing a new 21 ft² insulated door with an R-value of 11, savings with a 10.5 SEER central AC system and a 2.26 (1.92 including distribution losses) COP Heat Pump:

 $\begin{array}{l} \Delta k W h &= \Delta k W h_{cooling} + \Delta k W h_{heating} \\ &= (((1/3.125 - 1/11) * 21 * 616 * 24 * 0.75) / (1000 * 10.5)) + (((1/3.125 - 1/11) * 21 * 6,391 * 24) / (3,412 * 1.92)) \\ &= 5.1 \, k W h + 112.6 \, k W h \\ &= 117.7 \, k W h \end{array}$

If the building is heated with a gas furnace, there will be some electric savings in heating the building attributed to extra insulation since the furnace fans will run less.

$$\Delta kWh_{heating} = \Delta Therms * F_e * 29.3$$

Where:

ΔTherms	= Gas savings calculated with equation below.
Fe	= Percentage of heating energy consumed by fans, assume $3.14\%^{901}$
29.3	= Conversion from therms to kWh

⁸⁹⁹ National Climatic Data Center, calculated from 1981-2010 climate normals with a base temp of 60°F, consistent with the findings of Belzer and Cort, Pacific Northwest National Laboratory in "Statistical Analysis of Historical State-Level Residential Energy Consumption Trends," 2004.

⁹⁰⁰ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Heat Pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

⁹⁰¹ F_e is not one of the AHRI certified ratings provided for residential furnaces, but can be reasonably estimated from a calculation based on the certified values for fuel energy (Ef in MMBtu/yr) and Eae (kWh/yr). An average of a 300 record sample (non-random) out of 1495 was 3.14%. This is, appropriately, ~50% greater than the Energy Star version 3 criteria for 2% F_e. See "Furnace Fan Analysis.xlsx" for reference.

For example, for a single family home in Mason City installing a new 21 ft² insulated door with an R-value of 11, savings with a gas furnace with system efficiency of 74%: $\Delta kWh = 10.0 * 0.0314 * 29.3$ = 9.2 kWh

SUMMER COINCIDENT PEAK DEMAND SAVINGS

 $\Delta kW = (\Delta kWh_{cooling} / FLH_{cooling}) * CF$

Where:

FLH_{cooling} = Full load hours of air conditioning

= Dependent on location:⁹⁰²

Climate Zone (City based upon)	Single Family	Multifamily	Manufactured
Zone 5 (Burlington)	918	736	865
Zone 6 (Mason City)	468	375	441
Average/ unknown	811	650	764

CF

= Summer System Peak Coincidence Factor for Cooling

= 68% if central AC; 72% if ducted ASHP or ductless HP used for whole home conditioning;⁹⁰³ 43.1% for ductless HP used as supplemental or limited zone⁹⁰⁴

For example, for a single family home in Mason City installing a new 21 ft² insulated door with an R-value of 11, savings for a 10.5 SEER central AC system:

 $\Delta kW = 5.1 / 468 * 0.68$ = 0.0074 kW

NATURAL GAS SAVINGS

If building uses a gas heating system, the savings resulting from the insulation is calculated with the following formula.

$$\Delta \text{Therms} = \frac{\left(\frac{1}{R_{existing}} - \frac{1}{R_{new}}\right) * Area * HDD * 24}{(100,000 * \eta_{heat})}$$

Where:

Rexisting	= Existing door heat loss [(hr- ^o F-ft ²)/Btu]
R _{new}	= New door heat loss coefficient [(hr- ^o F-ft ²)/Btu]
Area	= Area of the door surface in square feet.
HDD	= Heating Degree Days

⁹⁰² Full load hours for Des Moines are provided based on Cadmus modeling for the 2011 Joint Assessment. The other locations were calculated based on relative Cooling Degree Day ratios (from NCDC).

⁹⁰³ Based on analysis of metering results from homes in Ameren Illinois service territory in PY5; 'Impact and Process Evaluation of Ameren Illinois Company's Residential HVAC Program (PY5)'.

⁹⁰⁴ Based on analysis of metering results from Ameren Illinois; Cadmus, "All-Electric Homes: PY6 Metering Results: Multifamily HVAC Systems", October 6, 2015.

= Dependent on location:905

	Climate Zone (City based upon) HDD 60		
	Zone 5 (Burlington)	4,496	
	Zone 6 (Mason City)	6,391	
	Average/ unknown	5,052	
100,000	= Conversion from BTUs to Therms		
η_{heat}	= Efficiency of heating system		
	= Equipment efficiency * distribution efficiency		
	= Actual ⁹⁰⁶ – If unknown, assume 74% for unsealed ducts ⁹⁰⁷ or 87% for sealed ducts		
• • •	le , for a single family home in Mason City installing a new 21 ft ² insulated door with an R-value of 11, th a gas furnace with system efficiency of 74%:		
ΔTherms	= (((1/3.125 - 1/11) * 21 * 6,391 * 24) / (100,000 * 0.74))		
	= 10.0 therms		

PEAK GAS SAVINGS

 $\Delta PeakTherms = \Delta Therms * GCF$

Where:

ΔTherms	= Therm impact calculated above
GCF	= Gas Coincidence Factor for Heating ⁹⁰⁸
	= 0.014378 for Residential Boiler
	= 0.016525 for Residential Space Heating (other)
	= 0.016525 for Residential Space Heating (other)

For example, for a single family home in Mason City installing a new 21 ft² insulated door with an R-value of 11, savings with a gas furnace with system efficiency of 74%:

ΔPeakTherms = 10.0 * 0.016525 = 0.1653 therms

⁹⁰⁵ National Climatic Data Center, calculated from 1981-2010 climate normals with a base temp of 60°F, consistent with the findings of Belzer and Cort, Pacific Northwest National Laboratory in "Statistical Analysis of Historical State-Level Residential Energy Consumption Trends," 2004.

⁹⁰⁶ Ideally, the System Efficiency should be obtained either by recording the AFUE of the unit, or performing a steady state efficiency test. The Distribution Efficiency can be estimated via a visual inspection and by referring to a look up table such as that provided by the Building Performance Institute: (<u>http://www.bpi.org/files/pdf/DistributionEfficiencyTable-BlueSheet.pdf</u>) or by performing duct blaster testing.

⁹⁰⁷ This has been estimated assuming that natural gas central furnace heating is typical for Iowa residences (the predominant heating is gas furnace with 49% of Iowa homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey)). In 2000, 60% of furnaces purchased in Iowa were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.60*0.92) + (0.40*0.8)) * (1-0.15) = 0.74.
⁹⁰⁸ Calculated using Cadmus provided Gas Loadshapes as the maximum daily load for the end use.

MEASURE CODE: RS-SHL-DOOR-V03-200101

SUNSET DATE: 1/1/2021*

* Currently, no utilities are offering this measure, and it is therefore overdue for a reliability review. If a utility plans to start using this measure again it should be reviewed accordingly.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.6 Floor Insulation Above Crawlspace

2.6.6 Floor Insulation Above Crawlspace

DESCRIPTION

Insulation is added to the floor above a vented crawl space that does not contain pipes or HVAC equipment. If there are pipes, HVAC, or a basement, it is desirable to keep them within the conditioned space by insulating the crawl space walls and ground. Insulating the floor separates the conditioned space above from the space below the floor and is only acceptable when there is nothing underneath that could freeze or would operate less efficiently in an environment resembling the outdoors. Even in the case of an empty, unvented crawl space, it is still considered best practice to seal and insulate the crawl space perimeter rather than the floor. Not only is there generally less area to insulate this way, but there are also moisture control benefits. There is a "Basement Insulation" measure for perimeter sealing and insulation. This measure assumes the insulation is installed above an unvented crawl space or unconditioned garage and should not be used in other situations.

Note unconditioned means a space that is not intentionally heated via furnace vents or boiler radiators. The presence of and/or leakage from a heating system in a space doesn't in itself imply the space is conditioned.

If sealing of ducts is unknown, the sealed efficiency should be used.

This measure was developed to be applicable to the following program types: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The requirements for participation in the program will be defined by the utilities.

DEFINITION OF BASELINE EQUIPMENT

The existing condition will be evaluated by implementation staff or a participating contractor and is likely to be no insulation on any surface surrounding a crawl space or garage.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 25 years.⁹⁰⁹

DEEMED MEASURE COST

The actual installed cost for this measure should be used in screening.

⁹⁰⁹ Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, 2007

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.6.6 Floor Insulation Above Crawlspace

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

Where available savings from shell insulation measures should be determined through a custom analysis. When that is not feasible for the program the following engineering algorithms can be used with the inclusion of an adjustment factor to de-rate the heating savings.

$$\Delta kWh = (\Delta kWh_cooling + \Delta kWh_heating)$$

Where:

∆kWh cooling = If central cooling, reduction in annual cooling requirement due to insulation $=\frac{\left(\frac{1}{R_{old}}-\frac{1}{(R_{Added}+R_{old})}\right)*Area*(1-Framing\ Factor)*CDD*24*DUA}{(1000*\eta Cool)}$

Rold	= R-value value of floor before insulation, assuming 3/4" plywood subfloor and carpet with pad		
	= Actual. If unknown assume 3.96 910		
RAdded	= R-value of additional spray foam, rigid foam, or cavity insulation.		
	= Actual ⁹¹¹		
Area	= Total floor area to be insulated		
Framing Factor	= Adjustment to account for area of framing		
	= 12% ⁹¹²		
24	= Converts hours to days		
CDD	= Cooling Degree Days		
	Climate Zone Unconditioned Space		

Climate Zone	Unconditioned Space
(City based upon)	CDD 75 ⁹¹³
Zone 5 (Burlington)	411
Zone 6 (Mason City)	264
Average/ unknown	474

⁹¹⁰ Based on 2005 ASHRAE Handbook – Fundamentals: assuming 2x8 joists, 16" OC, ¾" subfloor, ½" carpet with rubber pad, and accounting for a still air film above and below: 1/[(0.85 cavity share of area/(0.68 + 0.94 + 1.23 + 0.68)) + (0.15 framing)share / (0.68 + 7.5" * 1.25 R/in + 0.94 + 1.23 + 0.68))] = 3.96

⁹¹¹ If open cavity, add new insulation value to the default or evaluated existing assembly R-value (Rold). If closed cavity, since you are displacing one or two air layers, reduce the default or evaluated existing assembly R-value by one and add to new insulation. Note, if existing insulation is added to/not removed – always re-evaluate R-value of existing insulation as it may have been degraded significantly due to compression etc.

⁹¹² ASHRAE, 2001, "Characterization of Framing Factors for New Low-Rise Residential Building Envelopes (904-RP)," Table 7.1 ⁹¹³ The base temperature should be the outdoor temperature at which the desired indoor temperature stays constant, in balance with heat loss or gain to the outside and internal gains. Since unconditioned basements are allowed to swing in temperature, are ground coupled, and are usually cool, they have a bigger delta between the two (heating and cooling) base temperatures. 75F for cooling and 50F for heating are used based on professional judgment. Five year average cooling degree days with 75F base temp are provided from DegreeDays.net because the 30 year climate normals from NCDC are not available at base temps above 72F.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.6 Floor Insulation Above Crawlspace

DUA = Discretionary Use Adjustment (reflects the fact that people do not always operate their AC when conditions may call for it).

= 0.75 ⁹¹⁴

1000 = Converts Btu to kBtu

ηCool = Seasonal Energy Efficiency Ratio of cooling system (kBtu/kWh)

= Actual (where it is possible to measure or reasonably estimate). If unknown assume the following:⁹¹⁵

Age of Equipment	ηCool Estimate Sealed Duct Estimate	ηCool Unsealed Duct Estimate (nCool Sealed * 0.85)
Before 2006	10	8.5
2006 - 2014	13	11
Central AC After 1/1/2015	13	11
Heat Pump After 1/1/2015	14	12

ΔkWh_heating = If electric heat (resistance or heat pump), reduction in annual electric heating due to insulation

$$=\frac{\left(\frac{1}{R_{old}}-\frac{1}{(R_{Added}+R_{old})}\right)*Area*(1-Framing Factor)*HDD*24*ADJ_{Floor}}{(RHast + 2412)}$$

 $(\eta Heat * 3412)$

HDD

= Heating Degree Days:

Climate Zone (City based upon)	Unconditioned Space
(City based upon)	HDD 50 ⁹¹⁶
Zone 5 (Burlington)	2,678
Zone 6 (Mason City)	4,222
Average/ unknown	3,126

ηHeat

= Efficiency of heating system

= Actual. If not available refer to default table below:⁹¹⁷

⁹¹⁴ Energy Center of Wisconsin, May 2008 metering study; "Central Air Conditioning in Wisconsin, A Compilation of Recent Field Research", p31.

⁹¹⁵ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Central AC was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time mean that using the minimum standard is appropriate.

⁹¹⁶ The base temperature should be the outdoor temperature at which the desired indoor temperature stays constant, in balance with heat loss or gain to the outside and internal gains. Since unconditioned basements are allowed to swing in temperature, are ground coupled, and are usually cool, they have a bigger delta between the two (heating and cooling) base temperatures. 75F for cooling and 50F for heating are used based on professional judgment. National Climatic Data Center, calculated from 1981-2010 climate normals.

⁹¹⁷ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Heat Pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.6 Floor Insulation Above Crawlspace

⁹²⁵ Calculated using Cadmus provided Gas Loadshapes as the maximum daily load for the end use.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.7 Basement Sidewall Insulation

2.6.7 Basement Sidewall Insulation

DESCRIPTION

Insulation is added to a basement or crawl space. Insulation added above ground in conditioned space is modeled the same as wall insulation. Below ground insulation is adjusted with an approximation of the thermal resistance of the ground. Insulation in unconditioned spaces is modeled by reducing the degree days to reflect the smaller but non-zero contribution to heating and cooling load. Cooling savings only consider above grade insulation, as below grade has little temperature difference during the cooling season.

Note unconditioned means a space that is not intentionally heated via furnace vents or boiler radiators. The presence of and/or leakage from a heating system in a space doesn't in itself imply the space is conditioned.

If sealing of ducts is unknown, the sealed efficiency should be used.

This measure was developed to be applicable to the following program types: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The requirements for participation in the program will be defined by the utilities.

DEFINITION OF BASELINE EQUIPMENT

The existing condition will be evaluated by implementation staff or a participating contractor and is likely to be no basement wall or ceiling insulation.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 25 years.⁹²⁶

DEEMED MEASURE COST

The actual installed cost for this measure should be used in screening.

Algorithm

CALCULATION OF SAVINGS

ELECTRIC ENERGY SAVINGS

Where available savings from shell insulation measures should be determined through a custom analysis. When that

⁹²⁶ Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, GDS Associates, 2007

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.7 Basement Sidewall Insulation

is not feasible for the program the following engineering algorithms can be used with the inclusion of an adjustment factor to de-rate the heating savings.

$$\Delta kWh = (\Delta kWh_cooling + \Delta kWh_heating)$$

Where:

ΔkWh_cooling = If central cooling, reduction in annual cooling requirement due to insulation

$$=\frac{\left(\frac{1}{R_{OldAG}}-\frac{1}{(R_{Added}+R_{OldAG})}\right)*L_{BWT}*H_{BWAG}*(1-FF)*CDD*24*DUA}{(1000*nCool)}$$

R_{Added}

CDD

= R-value of additional spray foam, rigid foam, or cavity insulation.

= Actual⁹²⁷

R_{OldAG} = R-value value of foundation wall above grade.

- = Actual, if unknown assume 1.0⁹²⁸
- L_{BWT} = Length (Basement Wall Total) of basement wall around the entire insulated perimeter (ft)
- H_{BWAG} = Height (Basement Wall Above Grade) of insulated basement wall above grade (ft)
- FF = Framing Factor, an adjustment to account for area of framing when cavity insulation is used
 - = 0% if Spray Foam or External Rigid Foam
 - = 25% if studs and cavity insulation⁹²⁹
- 24 = Converts hours to days
 - = Cooling Degree Days
 - = Dependent on location and whether basement is conditioned:

Climate Zone	Conditioned Space	Unconditioned Space
(City based upon)	CDD 65 ⁹³⁰	CDD 75 ⁹³¹
Zone 5 (Burlington)	1,209	411
Zone 6 (Mason City)	616	264
Average/ unknown	1,068	474

 $^{^{927}}$ If open cavity, add new insulation value to the default or evaluated existing assembly R-value (R_{old}). If closed cavity, since you are displacing one or two air layers, reduce the default or evaluated existing assembly R-value by one and add to new insulation. Note, if existing insulation is added to/not removed – always re-evaluate R-value of existing insulation as it may have been degraded significantly due to compression etc.

⁹²⁸ ORNL Builders Foundation Handbook, crawl space data from Table 5-5: Initial Effective R-values for Uninsulated Foundation System and Adjacent Soil, 1991. See reference file "ORNL Builders Foundation Handbook."

 ⁹²⁹ ASHRAE, 2001, "Characterization of Framing Factors for New Low-Rise Residential Building Envelopes (904-RP)," Table 7.1
 ⁹³⁰ National Climatic Data Center, calculated from 1981-2010 climate normals with a base temp of 65°F.

⁹³¹ The base temperature should be the outdoor temperature at which the desired indoor temperature stays constant, in balance with heat loss or gain to the outside and internal gains. Since unconditioned basements are allowed to swing in temperature, are ground coupled, and are usually cool, they have a bigger delta between the two (heating and cooling) base temperatures. 75F for cooling and 50F for heating are used based on professional judgment. Five year average cooling degree days with 75F base temp are provided from DegreeDays.net because the 30 year climate normals from NCDC are not available at base temps above 72F.

Iowa Energy Efficiency Statewide Technical Reference Manual – 2.6.7 Basement Sidewall Insulation

DUA = Discretionary Use Adjustment (reflects the fact that people do not always operate their AC when conditions may call for it).

= 0.75 ⁹³²

1000 = Converts Btu to kBtu

ηCool = Seasonal Energy Efficiency Ratio of cooling system (kBtu/kWh)

= Actual (where it is possible to measure or reasonably estimate). If unknown assume the following:⁹³³

Age of Equipment	ηCool Sealed Duct Estimate	ηCool Unsealed Duct Estimate (nCool Sealed * 0.85)
Before 2006	10	8.5
2006 - 2014	13	11
Central AC After 1/1/2015	13	11
Heat Pump After 1/1/2015	14	12

ΔkWh_heating = If electric heat (resistance or heat pump), reduction in annual electric heating due to insulation

$$= \frac{\left(\left(\left(\frac{1}{R_{oldAG}} - \frac{1}{(R_{Added} + R_{oldAG})}\right) * L_{BWT} * H_{BWAG} * (1 - FF)\right) + \left(\left(\left(\frac{1}{R_{oldBG}} - \frac{1}{(R_{Added} + R_{oldBG})}\right) * L_{BWT} * (H_{BWT} - H_{BWAG}) * (1 - FF)\right)\right) + HDD * 24 * DUA * ADJ_{Basement}}{(3412 * \eta Heat)}$$

Where

Roldbg

= R-value value of foundation wall below grade (including thermal resistance of the earth) ⁹³⁴

= dependent on depth of foundation (H_basement_wall_total – H_basement_wall_AG):

= Actual R-value of wall plus average earth R-value by depth in table below

For example, for an area that extends 5 feet below grade, an R-value of 7.46 would be selected and added to the existing insulation R-value.

Below Grade R-value									
Depth below grade (ft)	0	1	2	3	4	5	6	7	8
Earth R-value (°F-ft ² -h/Btu)	2.44	4.50	6.30	8.40	10.44	12.66	14.49	17.00	20.00
Average Earth R-value (°F-ft2-h/Btu)	2.44	3.47	4.41	5.41	6.42	7.46	8.46	9.53	10.69
Total BG R-value (earth + R-1.0 foundation) default	3.44	4.47	5.41	6.41	7.42	8.46	9.46	10.53	11.69

⁹³² This factor's source is: Energy Center of Wisconsin, May 2008 metering study; "Central Air Conditioning in Wisconsin, A Compilation of Recent Field Research", p31.

⁹³³ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Central AC was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time mean that using the minimum standard is appropriate.

⁹³⁴ Adapted from Table 1, page 24.4, of the 1977 ASHRAE Fundamentals Handbook

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.7 Basement Sidewall Insulation

H_{BWT} = Total height of basement wall (ft)

HDD = Heating Degree Days

= dependent on location and whether basement is conditioned:

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.7 Basement Sidewall Insulation

conditioning;941 43.1% for ductless HP used as supplemental or limited zone942

For example, a single family home in Mason City with a 20 by 25 by 7 foot unconditioned basement, with 3 feet above grade, insulated with R-13 of interior spray foam, 10.5 SEER Central AC and 2.26 COP Heat Pump: $\Delta kW = 46.3 / 468 * 0.68$

= 0.0673 kW

NATURAL GAS SAVINGS

If Natural Gas heating:

∆Therms =

$$= \frac{\left(\left(\left(\frac{1}{R_{oldAG}} - \frac{1}{(R_{Added} + R_{oldAG})}\right) * L_{BWT} * H_{BWAG} * (1 - FF)\right) + \left(\left(\left(\frac{1}{R_{oldBG}} - \frac{1}{(R_{Added} + R_{oldBG})}\right) * L_{BWT} * (H_{BWT} - H_{BWAG}) * (1 - FF)\right)\right) * HDD * 24 * ADJ_{Basement}}{(100.000 * nHeat)}$$

Where

ηHeat	= Efficiency of heating system	
	= Equipment efficiency * distribution efficiency	
	= Actual ⁹⁴³ – If unknown, assume 74% for unsealed ducts ⁹⁴⁴ or 87% for sealed ducts	
100,000	= Converts Btu to Therms	
	Other factors as defined above	
• • •	amily home in Mason City with a 20 by 25 by 7 foot R-2.25 basement, with 3 feet above -13 of interior spray foam, and a 74% efficient furnace:	

= 153.3 therms

⁹⁴¹ Based on analysis of metering results from homes in Ameren Illinois service territory in PY5; 'Impact and Process Evaluation of Ameren Illinois Company's Residential HVAC Program (PY5)'.

⁹⁴² Based on analysis of metering results from Ameren Illinois; Cadmus, "All-Electric Homes: PY6 Metering Results: Multifamily HVAC Systems", October 6, 2015.

⁹⁴³ Ideally, the System Efficiency should be obtained either by recording the AFUE of the unit, or performing a steady state efficiency test. The Distribution Efficiency can be estimated via a visual inspection and by referring to a look up table such as that provided by the Building Performance Institute: (<u>http://www.bpi.org/files/pdf/DistributionEfficiencyTable-BlueSheet.pdf</u>) or by performing duct blaster testing.

⁹⁴⁴ This has been estimated assuming that natural gas central furnace heating is typical for lowa residences (the predominant heating is gas furnace with 49% of lowa homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey)). In 2000, 60% of furnaces purchased in Iowa were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.60*0.92) + (0.40*0.8)) * (1-0.15) = 0.74.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.7 Basement Sidewall Insulation

PEAK GAS SAVINGS				
	$\Delta PeakTherms = \Delta Therms * GCF$			
Where:				
	∆Therms	= Therm impact calculated above		
	GCF	= Gas Coincidence Factor for Heating ⁹⁴⁵		
		= 0.014378 for Residential Boiler		
		= 0.016525 for Residential Space Heating (other)		

For example, a single family home in Mason City with a 20 by 25 by 7 foot R-2.25 basement, with 3 feet above grade, insulated with R-13 of interior spray foam, and a 74% efficient furnace:

ΔPeakTherms = 153.3 therms * 0.016525 = 2.53 therms

Iowa Energy Efficiency Statewide Technical Reference Manual-2.6.8 Efficient Windows

2.6.8 Efficient Windows

DESCRIPTION

This measure describes savings realized by the purchase and installation of new windows that have better thermal insulating properties compared to code requirements. Code does not specify solar heat gain coefficient requirements for residential windows and therefore no impacts are quantified or claimed. For a comprehensive estimate of impacts, computer modeling is recommended.

If sealing of ducts is unknown, the sealed efficiency should be used.

This measure was developed to be applicable to the following program types: NC, TOS.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient solution is a window assembly with a U-factor that is better than code.

DEFINITION OF BASELINE EQUIPMENT

The baseline condition is a window assembly with a U-factor equal to code requirements.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is assumed to be 20 years.⁹⁴⁶

DEEMED MEASURE COST

The incremental cost for this measure is assumed to be \$1.50 per square foot of window area.⁹⁴⁷

LOADSHAPE

 ⁹⁵⁹ This has been estimated assuming that natural gas central furnace heating is typical for Iowa residences (the predominant heating is gas furnace with 49% of Iowa homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey)). In 2000, 60% of furnaces purchased in Iowa were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace
 Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.60*0.92) + (0.40*0.8)) * (1-0.15) = 0.74.
 ⁹⁶⁰ Calculated using Cadmus provided Gas Loadshapes as the maximum daily load for the end use.

Iowa Energy Efficiency Statewide Technical Reference Manual-2.6.8 Efficient Windows

= 0.014378 for Residential Boiler

= 0.016525 for Residential Space Heating (other)

For example, for a single family home in Mason City installs 15 new identically sized 2' x 4' windows with a 0.25 U-Factor. Savings with a gas furnace with system efficiency of 74%:

ΔPeakTherms = 11 * 0.016525

= 0.18 therms

* Currently, no utilities are offering this measure, and it is therefore overdue for a reliability review. If a utility plans to start using this measure again it should be reviewed accordingly.

Iowa Energy Efficiency Statewide Technical Reference Manual -2.6.9 Window Insulation Kits

2.6.9 Window Insulation Kits

DESCRIPTION

This measure describes savings from installing seasonal window insulation kits during the heating season. Kits generally include tape and shrink film that is applied to window moldings to create a static air layer between the interior of the home and the window surface. There are three principal mechanisms that constitute heat transfer through windows: Air leakage/infiltration, temperature driven heat transfer, and solar gains. Due to the complexities and uncertainties related to estimating how air leakage/infiltration rates may be affected by retrofit activities, and the potential for double-counting savings claimed through separate air sealing measures, only temperature driven heat transfer is considered. Window insulation kits are considered a seasonal measure during the heating season and thus savings are only heating energy savings are claimed.

It is recommended that a member of the implementation staff evaluate the pre- and post-project R-values, measure surface areas, and evaluate the efficiency of the heating equipment in the home. Additionally, installation quality should be verified, as this measure relies on the creation of a static air layer to be effective.

If sealing of ducts is unknown, the sealed efficiency should be used.

This measure was developed to be applicable to the following program types: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The efficient solution is one that effectively creates a static air layer in series with the existing window (can be on either side of the window) and the outdoor environment. The requirements for participation in the program will be defined by the utilities.

DEFINITION OF BASELINE EQUIPMENT

The existing condition is the pre-retrofit window assembly.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The expected measure life is one year.

DEEMED MEASURE COST

The actual installed cost for this measure should be used in screening.

Algorithm

CALCULATION OF SAVINGS

The following calculations apply to a single window assembly.

ELECTRIC ENERGY SAVINGS

 $\Delta kWh = \Delta kWh_{heating}$

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.9 Window Insulation Kits

= Net area of insulated window (ft ²)		
= Actual. If unknown, assume 8 ft ² (24 inch x 48 inch)		

5,052

 η_{heat}

= Efficiency of heating system

Average/ unknown

= Actual – If not available, refer to default table below:⁹⁶⁴

System Type		HSPF Estimate	ηHeat (Effective	nHeat (Effective
	Age of Equipment		COP Estimate)	COP Estimate)
			with unsealed	with Sealed Ducts
			ducts	(HSPF/3.412)
			(HSPF/3.412)*0.85	
	Before 2006	6.8	1.69	1.99
Heat Pump	2006 - 2014	7.7	1.92	2.26
	2015 and after	8.2	2.04	2.40
Resistance	N/A	N/A	1.00	1.00

3412 = Converts Btu to kWh

ADJ_{window} = Adjustment for wall insulation to account for prescriptive engineering algorithms

⁹⁶¹ A typical R-value for a double-pane window and consistent with the assumptions outlined in the MidAmerican Energy Company Joint Assessment (February 2013) for existing windows.

⁹⁶² Based on PNNL report 2444-2. Experimental data showed that an air gap greater than 0.5 inches had virtually no impact on insulation properties, and that and R-value of 2.85 is expected for any air gap greater than 0.5 inches.

⁹⁶³ National Climatic Data Center, calculated from 1981-2010 climate normals with a base temp of 60°F, consistent with the findings of Belzer and Cort, Pacific Northwest National Laboratory in "Statistical Analysis of Historical State-Level Residential Energy Consumption Trends," 2004.

⁹⁶⁴ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Heat Pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

Iowa Energy Efficiency Statewide Technical Reference Manual-2.6.9 Window Insulation Kits

consistently overclaiming savings

= 63%⁹⁶⁵

For example, for a single family home in Mason City with 15 identically sized 2' x 4' windows installs window insulation film with a 4-inch air layer. Heating savings with a 2.26 (1.92 including distribution losses) COP Heat Pump:

=	ΔkWh _{heating} [(1/2 - 1/(2+4)) * ξ 590 kWh	3 * 6391 * 24 * 0.63) / (1.92 * 3412))] * 15		
$\Delta kWh_{heating}$	= If gas <i>furna</i>	ce heat, kWh savings for reduction in fan run time		
	= ΔTherms *	= Δ Therms * F _e * 29.3		
	Where:			
	Fe	 Furnace Fan energy consumption as a percentage of annual fuel consumption 		
		= 3.14% ⁹⁶⁶		
	29.3	= kWh per therm		
	Where: F _e 29.3	 Furnace Fan energy consumption as a percentage of annual fue consumption = 3.14%⁹⁶⁶ 		

For example, for a single family home in Mason City with 15 identically sized 2' x 4' windows installs window insulation film with a 4-inch air layer. Savings with a gas furnace with system efficiency of 74%:

ΔkWh = 52 * 0.0314 * 29.3 = 48 kWh

SUMMER COINCIDENT PEAK DEMAND SAVINGS

N/A

NATURAL GAS SAVINGS

ΔTherms (if Natural Gas heating)

$$=\frac{\left(\frac{1}{R_{old}}-\frac{1}{R_{old}+R_{New}}\right)*A_{window}*HDD*24*ADJ_{window}}{(\eta_{heat}*100,000)}$$

Where:

ηHeat

= Efficiency of heating system

= Equipment efficiency * distribution efficiency

⁹⁶⁵ Based upon comparing algorithm derived savings estimate and evaluated bill analysis estimate in the following 2012 Massachusetts report: "Home Energy Services Impact Evaluation", August 2012. See "Insulation ADJ calculations.xls" for details or calculation. The adjustment for walls was assumed to be an appropriate adjustment for windows.

⁹⁶⁶ F_e is not one of the AHRI certified ratings provided for residential furnaces, but can be reasonably estimated from a calculation based on the certified values for fuel energy (Ef in MMBtu/yr) and Eae (kWh/yr). An average of a 300 record sample (non-random) out of 1495 was 3.14%. This is, appropriately, ~50% greater than the Energy Star version 3 criteria for 2% F_e. See "Furnace Fan Analysis.xlsx" for reference.

Iowa Energy Efficiency Statewide Technical Reference Manual -2.6.10 Storm Windows

2.6.10 Storm Windows

DESCRIPTION

Storm windows installed on either the interior or exterior of existing window assemblies can reduce both heating and cooling loads by reducing infiltration and solar heat gain and improving insulation properties. Glass options for storm windows can include traditional clear glazing as well as low-emissivity (Low-E) glazing. Low-E glass is formed by adding an ultra-thin layer of metal to clear glass. The metallic-oxide (pyrolytic) coating is applied when the glass is in its molten state, and the coating becomes a permanent and extremely durable part of the glass. This coating is also known as "hard-coat" Low-E. Low-E glass is designed to redirect heat back towards the source, effectively providing higher insulating properties and lower solar heat gain as compared to traditional clear glass. This characterization captures the savings associated with installing storm windows to an existing window assembly (retrofit).

If sealing of ducts is unknown, the sealed efficiency should be used.

This measure was developed to be applicable to the following program types: RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

An interior or exterior storm window installed according to manufacturer specifications.

DEFINITION OF BASELINE EQUIPMENT

The existing window assembly.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

20 years970

DEEMED MEASURE COST

The actual capital cost for this measure should be used when available and include both material and labor costs. If unavailable, the cost for a low-e storm window can be assumed as \$7.85/ft² of window area (material cost) plus \$30 per window for installation expenses.⁹⁷¹ For clear glazing, cost can be assumed as \$6.72/ft² of window area (material cost) plus \$30 per window for installation expenses.⁹⁷²

Algorithm

CALCULATION OF SAVINGS

The following reference tables show savings factors (kBtu/ft²) for both heating and cooling loads for each of the weather zones defined by the TRM.⁹⁷³ They are used with savings equations listed in the electric energy and gas savings sections to produce savings estimates. If storm windows are left installed year-round, both heating and cooling savings may be claimed. If they are installed seasonally, only heating savings should be claimed. Savings are dependent on location, storm window location (interior or exterior), glazing type (clear or Low-E) and existing window assembly type.

ELECTRIC ENERGY SAVINGS

$$\Delta kWh = \Delta kWh_cooling + \Delta kWh_heating$$

Where:

 $\Delta kWh_cooling$

 $arphi_{\mathsf{cool}}$ A

If storm windows are left installed during the cooling season and the home has central cooling, the reduction in annual cooling requirement

$$= \frac{\varphi_{cool} * A}{\eta Cool}$$

= Savings factor for cooling, as tabulated above.

= Area (square footage) of storm windows installed.

ηCool = Efficiency (SEER) of Air Conditioning equipment (kBtu/kWh)

= Actual (where it is possible to measure or reasonably estimate) – If unknown, assume the following:⁹⁷⁴

Age of Equipment	SEER Sealed Estimate	SEER Unsealed Estimate
Before 2006	10	8.5
2006 – 2014	13	11
Central AC After 1/1/2015	13	11
Heat Pump After 1/1/2015	14	12

⁹⁷⁴ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Central AC was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time mean that using the minimum standard is appropriate.

Iowa Energy Efficiency Statewide Technical Reference Manual -2.6.10 Storm Windows

 $\Delta kWh_heating = If electric heat (resistance or heat pump), reduction in annual electric heating$

$$= \frac{\varphi_{heat} * A}{\eta Heat * 3.412}$$

= Savings factor for heating, as tabulated above.

arphiheat

ηHeat

= Efficiency of heating system

= Actual – If not available refer to default table below:975

System Type	Age of Equipment	HSPF Estimate	ηHeat (Effective COP Estimate) with unsealed ducts (HSPF/3.412)*0.85	nHeat (Effective COP Estimate) with Sealed Ducts (HSPF/3.412)
	Before 2006	6.8	1.69	1.99
Heat Pump	2006 - 2014	7.7	1.92	2.26
	2015 and after	8.2	2.04	2.40
Resistance	N/A	N/A	1.00	1.00

3.412 = Converts kBtu to kWh

For example, for a single family home in Mason City installing 15 new identically sized 2' x 4' exterior low-e storm windows over existing double pane, double hung windows, savings for a 10.5 SEER Central AC system and a 2.26 (1.92 including distribution losses) COP Heat Pump:

 $\Delta kWh = \Delta kWh_{cooling} + \Delta kWh_{heating}$ = (((11.8 * 8) / 10.5) + ((32.4 * 8) / (1.92 * 3.412))) * 15

= 135 kWh + 593 kWh

= 728 kWh

 $\Delta kWh_heating = If gas furnace heat, kWh savings for reduction in fan run time$

=
$$\Delta$$
Therms * F_e * 29.3

Where:

F _e	= Furnace Fan energy consumption as a percentage of annual fuel consumption
	= 3.14% ⁹⁷⁶
29.3	= kWh per therm

⁹⁷⁵ These default system efficiencies are based on the applicable minimum Federal Standards. In 2006 the Federal Standard for Heat Pumps was adjusted. While one would expect the average system efficiency to be higher than this minimum, the likely degradation of efficiencies over time means that using the minimum standard is appropriate. An 85% distribution efficiency is then applied to account for duct losses for heat pumps.

⁹⁷⁶ F_e is not one of the AHRI certified ratings provided for residential furnaces, but can be reasonably estimated from a calculation based on the certified values for fuel energy (Ef in MMBtu/yr) and Eae (kWh/yr). An average of a 300 record sample (non-random) out of 1495 was 3.14%. This is, appropriately, ~50% greater than the Energy Star version 3 criteria for 2% F_e. See "Furnace Fan Analysis.xlsx" for reference.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.6.10 Storm Windows

For example, for a single family home in Mason City installing 15 new identically sized 2' x 4' exterior low-e storm windows over existing double pane, double hung windows, savings with a gas furnace with system efficiency of 74%:

ΔkWh = 52 * 0.0314 * 29.3 = 48 kWh

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW = \frac{\Delta kWh_{cooling}}{FLH_{cooling}} * CF$$

Where:

FLHcooling

= Full load hours of air conditioning

= Dependent on location:977

Climate Zone (City based upon)	Single Family	Multifamily	Manufactured
Zone 5 (Burlington)	918	736	865
Zone 6 (Mason City)	468	375	441
Average/ unknown	811	650	764

CF

= Summer System Peak Coincidence Factor for Cooling

= 68% if central AC; 72% if ducted ASHP or ductless HP used for whole home conditioning; 978 43.1% for ductless HP used as supplemental or limited zone 979

For example, for a single family home in Mason City installing 15 new identically sized 2' x 4' exterior low-e storm windows over existing double pane, double hung windows, savings for a 10.5 SEER Central AC system and a 2.26 (1.92 including distribution losses) COP Heat Pump:

ΔkW = 135 / 468 * 0.68 = 0.1962 kW

NATURAL GAS SAVINGS

If Natural Gas heating:

$$\Delta Therms = \frac{\varphi_{heat} * A}{\eta Heat * 100}$$

Where:

ηHeat

= Efficiency of heating system

= Equipment efficiency * distribution efficiency

⁹⁸⁰ Ideally, the System Efficiency should be obtained either by recording the AFUE of the unit, or performing a steady state efficiency test. The Distribution Efficiency can be estimated via a visual inspection and by referring to a look up table such as that provided by the Building Performance Institute: (<u>http://www.bpi.org/files/pdf/DistributionEfficiencyTable-BlueSheet.pdf</u> or by performing duct blaster testing.

 ⁹⁸¹ This has been estimated assuming that natural gas central furnace heating is typical for Iowa residences (the predominant heating is gas furnace with 49% of Iowa homes (based on Energy Information Administration, 2009 Residential Energy Consumption Survey). In 2000, 60% of furnaces purchased in Iowa were condensing (based on data from GAMA, provided to Department of Energy during the federal standard setting process for residential heating equipment - see Furnace
 Penetration.xls). Furnaces tend to last up to 20 years and so units purchased 15 years ago provide a reasonable proxy for the current mix of furnaces in the State. Assuming typical efficiencies for condensing and non-condensing furnaces and duct losses, the average heating system efficiency is estimated as follows: ((0.60*0.92) + (0.40*0.8)) * (1-0.15) = 0.74.
 ⁹⁸² Calculated using Cadmus provided Gas Loadshapes as the maximum daily load for the end use.

Iowa Energy Efficiency Statewide Technical Reference Manual-2.7.1 Residential Pool Pumps

2.7 Miscellaneous

2.7.1 Residential Pool Pumps

DESCRIPTION

Conventional residential outdoor pool pumps are single speed, often oversized, and run frequently at constant flow regardless of load. Single speed pool pumps require that the motor be sized for the task that requires the highest speed. As such, energy is wasted performing low speed tasks at high speed. Two speed and variable speed pool pumps reduce speed when less flow is required, such as when filtering is needed but not cleaning, and have timers that encourage programming for fewer on-hours. Variable speed pool pumps use advanced motor technologies to achieve efficiency ratings of 90% while the average single speed pump will have efficiency ratings between 30% and 70%.⁹⁸³ This measure applies to the purchase and installation of an efficient two speed or variable speed residential pool pump motor in place of a standard single speed motor of equivalent horsepower.

This measure was developed to be applicable to the following program types: TOS, NC, RF.

If applied to other program types, the measure savings should be verified.

DEFINITION OF EFFICIENT EQUIPMENT

The high efficiency equipment is an ENERGY STAR two speed or variable speed residential pool pump for in-ground pools. ENERGY STAR Pool Pump Specification Version 2.0 became effective on January 2, 2019. This characterization assumes incentivized products meet Version 2.0 requirements. Programs wishing to incentivize pumps meeting original ENERGY STAR qualification criteria should reference previous TRM versions.

DEFINITION OF BASELINE EQUIPMENT

The baseline equipment is a single speed residential pool pump. Note: Federal Standards applying to pool pumps are scheduled to become effective July 19, 2021 and will trigger a baseline shift. Also scheduled to coincide are ENERGY STAR Version 3.0 specifications for pool pumps.

DEEMED LIFETIME OF EFFICIENT EQUIPMENT

The estimated useful life for a two speed or variable speed pool pump is 10 years.⁹⁸⁴

DEEMED MEASURE COST

The incremental cost is estimated as \$235 for a two speed motor and \$549 for a variable speed motor.⁹⁸⁵ In retrofit instances, full replacement costs shall be used.

LOADSHAPE

Loadshape RE17 – Residential Pool Pumps

⁹⁸³ U.S. DOE, 2012. Measure Guideline: Replacing Single-Speed Pool Pumps with Variable Speed Pumps for Energy Savings. Report No. DOE/GO-102012-3534.

⁹⁸⁴ The CEE Efficient Residential Swimming Pool Initiative, p18, indicates that the average motor life for pools in use year round is 5-7 years. For pools in use for under a third of a year, the expected lifetime is higher, so 10 years is selected as an assumption. This is consistent with DEER 2014 and the ENERGY STAR Pool Pump Calculator assumptions.

⁹⁸⁵ Incremental costs are from ENERGY STAR Pool Pump Calculator.

CALCULATION OF ENERGY SAVINGS

ELECTRIC ENERGY SAVINGS986

$$\Delta kWh_{two speed} = (((Hrs/Day_{Base} * GPM_{Base} * 60)/EF_{Base}) - (((Hrs/Day_{2spH} * GPM_{2spH} * 60) + (Hrs/Day_{2spL} * GPM_{2spL} * 60))/WEF_{2sp}))/1,000 * Days$$

$$\Delta kWh_{variable \ speed} = (((Hrs/Day_{Base} * GPM_{Base} * 60)/EF_{Base}) - (((Hrs/Day_{vsH} * GPM_{vsH} * 60) + (Hrs/Day_{vsL} * GPM_{vsL} * 60))/WEF_{vs}))/1,000 * Days$$

Where:

Hrs/Day _{Base}	= Run hours of single speed pump
	= 11.4
GPM _{Base}	= Flow of single speed pump (gal/min)
	= 64.4
60	= Minutes per hour
EF _{Base}	= Energy factor of single speed pump (gal/Wh)
	= 2.1
Hrs/Day _{2spH}	= Run hours of two speed pump at high speed
	= 2
GPM _{2spH}	= Flow of two speed pump at high speed (gal/min)
	= 56
WEF _{2sp}	= Weighted Energy Factor of two speed pump (gal/Wh)
	= 5.6 ⁹⁸⁷
Hrs/Day _{2spL}	= Run hours of two speed pump at low speed
	= 15.7
GPM _{2spL}	= Flow of two speed pump at low speed (gal/min)
	= 31
1,000	= Conversion factor from Wh to kWh
Days	= Pool operating days per year
	= 125 ⁹⁸⁸

⁹⁸⁶ Except where noted, savings methodology and assumptions are from the ENERGY STAR Pool Pump Calculator and assume a nameplate horsepower of 1.5 and a pool size of 22,000 gallons, with 2.0 turnovers per day in the base case and 1.5 turnovers per day in the efficient case.

⁹⁸⁷ Based on the average WEF of Energy Certified pumps as of 5/6/2019. See Referenced Document "certified-pool-pumps-2019-05-06.xlsx." Note: Energy Star uses units of kgal/kWh in specification of weighted energy factors, however this is identical to gal/Wh.

⁹⁸⁸ Assumes 50% of pools operate from Memorial Day through Labor Day (100 days) and 50% of pools operate for a longer span, typically the 5 month period between May and September (150 days), due to their ability to heat the pool.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.7.1 Residential Pool Pumps

Hrs/Day _{vsH}	= Run hours of variable speed pump at high speed
	= 2
GPM _{vsH}	= Flow of variable speed pump at high speed (gal/min)
	= 50
WEF _{vs}	= Weighted Energy Factor of variable speed (gal/Wh)
	= 8.1 ⁹⁸⁹
Hrs/Day _{vsL}	= Run hours of variable speed pump at low speed
	= 16
GPM _{vsL}	= Flow of variable speed pump at low speed (gal/min)
	= 30.6

Based on defaults provided above:

$\Delta kWh_{two \ speed}$	= (((11.4 * 64.4 * 60)/2.1) - (((2* 56 * 60) + (15.7 * 31 * 60))/5.6))/1000 * 125
	= 1,820.2 kWh
$\Delta kWh_{variable speed}$	= (((11.4 * 64.4 * 60)/2.1) - (((2* 50 * 60) + (16 * 30.6 * 60))/8.1))/1000 * 125
	= 2,076.1 kWh

SUMMER COINCIDENT PEAK DEMAND SAVINGS

$$\Delta kW_{two speed} = ((kWh/Day_{Base})/(Hrs/Day_{Base}) - (kWh/Day_{sp})/(Hrs/Day_{sp})) * CF \Delta kW_{variable speed} = ((kWh/Day_{Base})/(Hrs/Day_{Base}) - (kWh/Day_{var})/(Hrs/Day_{var})) * CF CF$$

Where:

kWh/Day _{Base}	= Daily energy consumption of single speed pool pump
	= 20.98
Hrs/Day _{base}	= Daily run hours of single speed pump
	= 11.4
kWh/Day _{2sp}	= Daily energy consumption of two speed pump
	= 6.41
Hr/Day _{2sp}	= Daily run hours of two speed pump
	= 17.7
kWh/Day _{vs}	= Daily energy consumption of variable speed pump
	= 4.37
Hr/Day _{vs}	= Daily run hours of variable speed pump

⁹⁸⁹ Based on the average WEF of Energy Certified pumps as of 5/6/2019 See Referenced Document "certified-pool-pumps-2019-05-06.xlsx." Note: Energy Star uses units of kgal/kWh in specification of weighted energy factors, however this is identical to gal/Wh.

Iowa Energy Efficiency Statewide Technical Reference Manual—2.7.1 Residential Pool Pumps

	= 18
CF	= Summer peak coincidence Factor for measure
	= 0.831 ⁹⁹⁰
$\Delta kW_{two \ speed}$	= ((20.98 / 11.4) – (6.41 / 17.7)) * 0.831
	= 1.228 kW
ΔkW variable speed	= ((20.98 / 11.4) – (4.37 / 18)) * 0.831
	= 1.328 kW
