PUBLIC VERSION
SUPPLEMENTAL DIRECT AND REBUTTAL TESTIMONY OF
DEVI GLICK
ON BEHALF OF ENVIRONMENTAL INTERVENORS

November 21, 2022

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

TABLE OF CONTENTS

LIST OF EXHIBITS	2
LIST OF TABLES	3
LIST OF FIGURES	4
1. Introduction and purpose of testimony	1
2. Findings and recommendations	3
3. MidAmerican has failed to justify the Wind PRIME portfolio using appropriate quantitative analysis in both its original application and in its updated application.....	7
4. MidAmerican's analysis of the benefits of the Wind PRIME portfolio relies on MidAmerican's aging coal resources for capacity, overlooking the significant costs that could be avoided by transitioning away from those resources and replacing them with alternatives.	15
i. MidAmerican's analysis in support of the Wind PRIME project neglects the substantial avoidable O&M and capex costs necessary to maintain its coal plants, [REDACTED]	16
ii. MidAmerican conducted two studies between 2019 and 2021 that evaluated the economics of retiring its coal fleet and replacing the units with alternative supply options; the results [REDACTED] the need for MidAmerican to [REDACTED]	21
iii. MidAmerican should use revenue sharing to pay off the undepreciated balances of uneconomic coal units first.	28
5. Energy Futures Group's modeling shows that a more balanced portfolio of resource additions which includes more solar and battery storage resources, and retires uneconomic coal plants, is lower cost and provides more round-the-clock clean energy than the Company's Wind PRIME portfolio as currently proposed.	36
i. MidAmerican's dismissal of industry standard capacity expansion modeling is concerning and unfounded	37
ii. Energy Futures Group's modeling improves upon Synapse's prior modeling by using Company-specific data and updated assumptions	39
iii. Modeling methodology	40
iv. Modeling results	45

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

6. MidAmerican's claims around the benefits of the Wind PRIME portfolio, both originally and after the passage of the IRA, are misleading and unsupported.....57

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 **1. INTRODUCTION AND PURPOSE OF TESTIMONY**

2 **Q Please state your name and occupation.**

3 **A My name is Devi Glick. I am a Senior Principal at Synapse Energy Economics,**
4 **Inc. (“Synapse”). My business address is 485 Massachusetts Avenue, Suite 3,**
5 **Cambridge, Massachusetts 02139.**

6 **Q On whose behalf are you testifying in this case?**

7 **A I am testifying on behalf of the Environmental Intervenors.**

8 **Q Are you the same Devi Glick that filed direct testimony in this docket?**

9 **A Yes.**

10 **Q What is the purpose of your supplemental direct and rebuttal testimony?**

11 **A In this supplemental direct and rebuttal testimony, I respond to MidAmerican**
12 **Energy Company’s (MidAmerican) claims about the need to move forward with**
13 **Wind PRIME as originally proposed, taking into account updates to the United**
14 **States tax code under the Inflation Reduction Act (IRA) of 2022. I review the**
15 **reasonableness and sufficiency of MidAmerican’s IRA updates to its Wind**
16 **PRIME application. I reiterate the importance of requiring MidAmerican to**
17 **evaluate the economics of its coal plants inclusive of the avoidable costs to**
18 **MidAmerican’s ratepayers if the Company were to retire the aging units and**
19 **replace them with alternatives. I present new modeling analysis completed by**
20 **Energy Futures Group in collaboration with Synapse that compares**
21 **MidAmerican’s current proposed course of action to an alternative reasonable set**
22 **of resource additions. I explain how our analysis supports approval of part of**
23 **Wind PRIME – specifically 50 MW of solar and roughly one third of the**

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 proposed wind. Finally, I review the flaws in MidAmerican's original application
2 and updated proposal and the Company's defense of the sufficiency of its analysis
3 to support moving forward with the full Wind PRIME project.

4 **Q How is your testimony structured?**

5 **A** In Section 2, I summarize my findings and recommendations for the Iowa
6 Utilities Board ("Board").

7 In Section 3, I discuss how MidAmerican has repeated the errors I identified in
8 my direct testimony and has still failed to justify its Wind PRIME portfolio in its
9 updated application. I explain that the Company should have used capacity
10 expansion modeling to evaluate alternative supply options to demonstrate the
11 reasonableness of the Wind PRIME portfolio. I also explain the updated pricing
12 assumptions MidAmerican should have used in its analysis given the passage of
13 the IRA.

14 In Section 4, I discuss how MidAmerican's failure to evaluate a reasonable
15 alternative resource portfolio for Wind PRIME results in the Company's
16 continued reliance on its aging and expensive coal fleet, resulting in higher
17 customer costs. I outline the avoidable costs incurred by this continued reliance
18 on uneconomic coal plants. I summarize the results of MidAmerican's two most
19 recent studies on the economics of its coal plants. I explain how the depreciation
20 schedules of the coal plants are tied to the revenue sharing mechanism and the
21 taxes and revenue from Wind PRIME. I also address why it is important for
22 MidAmerican to address optimal coal retirement decisions when making
23 decisions regarding new resource additions. Finally, I discuss how the Company
24 could better use the revenue sharing mechanism to pay for sunk coal plant costs
25 and how MidAmerican should link coal plant depreciation schedules to retirement
26 and removal from rate base.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 In Section 5, I discuss new modeling by Energy Futures Group done in
2 collaboration with Synapse that presents a quantitative approach to assessing the
3 Company's application and evaluates whether MidAmerican's Wind PRIME
4 proposal is a reasonable set of resource additions for ratepayers, inclusive of IRA
5 provisions. This modeling demonstrates that only parts of Wind PRIME should be
6 approved, and that alternative resource decisions—namely, increased supply
7 diversity through additions of battery storage and solar and retirements of coal
8 units—would provide a lower-cost portfolio for customers.

9 In Section 6, I discuss how some of MidAmerican's claims in rebuttal testimony
10 around the benefits of the Wind PRIME portfolio, both originally and after the
11 passage of the IRA, are misleading and unsupported.

12 **Q What documents do you rely upon for your analysis, findings, and**
13 **observations?**

14 **A** My analysis relies primarily upon the rebuttal testimony, workpapers, exhibits,
15 and new discovery responses of MidAmerican's witnesses. I also rely on public
16 information from other Board proceedings and other publicly available
17 documents.

18 **2. FINDINGS AND RECOMMENDATIONS**

19 **Q Please summarize your findings.**

20 **A** My primary findings are:

- 21 1. MidAmerican failed to justify moving forward with Wind PRIME by
22 demonstrating, in both its original and updated application, that its
23 proposal to add 2,042 megawatts (MW) of new wind generation and 50
24 MW of new solar photovoltaics (PV) is reasonable when compared with
25 other feasible supply options.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

- 1 2. MidAmerican failed to quantitatively assess how the change in
2 comparative economics of clean energy resources resulting from passage
3 of the IRA impacts what mix of resource additions are in customers' best
4 interests. Instead, MidAmerican kept the Wind PRIME resource portfolio
5 unchanged and updated only its calculations of the impact of the IRA on
6 Wind PRIME's net revenues.
- 7 3. MidAmerican's Wind PRIME portfolio was not developed using the kind
8 of analysis needed to demonstrate that the portfolio represents a
9 reasonable set of resource additions to serve MidAmerican's Iowa
10 ratepayers. A quantitative alternatives analysis is needed to evaluate the
11 resources proposed in Wind PRIME in the context of the utility's existing
12 resource mix - inclusive of all operations and maintenance (O&M) and
13 sustaining capital expenditure (capex) costs required to maintain its
14 existing resources (especially avoidable capex and O&M costs at its aging
15 legacy fossil units) - and to demonstrate that the project is reasonable
16 compared to alternative supply option.
- 17 4. MidAmerican asserts that Wind PRIME can be constructed at no net-cost
18 to customers. But that claim is based on MidAmerican inappropriately
19 crediting the project with "net system benefits," which represents [REDACTED]
20 of the total value MidAmerican attributes to the project (tax credits and
21 capacity sales account for the remainder). Net system benefits are tied
22 mainly to lower market prices expected with Wind PRIME, but the
23 Company itself has admitted that the projects in Wind PRIME will likely
24 be built regardless of whether MidAmerican or another party builds them.
25 Therefore, the lower market prices and resulting net benefits will be
26 realized regardless.
- 27 5. MidAmerican cites customers' desire for affordable and reliable carbon
28 free electricity to support the Wind PRIME project. But by assessing the
29 project's value based on energy generation and production tax credit
30 revenues, MidAmerican is not positioning the utility to create a reliable,
31 carbon-free electricity system. The Company is creating a wind-heavy
32 energy system that is dependent on coal for meeting capacity needs, rather
33 than integrating more solar and battery storage resources that exhibit
34 complementary output patterns.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

- 1 6. Energy Futures Group’s modeling shows that a balanced portfolio that
2 adds new solar, wind, and battery storage resources, and retires
3 MidAmerican’s existing coal plants by 2035, costs over \$120 million less
4 and provides more round-the-clock clean energy than the Company’s
5 Wind PRIME portfolio. This lower cost portfolio would substantially
6 improve the utility’s ability to phase out its carbon-intensive resources,
7 thus avoiding substantial operations and maintenance (O&M) and capital
8 expenditures (capex) costs. It will also allow MidAmerican to meet
9 customer expectations for truly carbon-free electricity.
- 10 7. MidAmerican has not evaluated the substantial capex and O&M - \$ [REDACTED]
11 [REDACTED] (if MidAmerican’s estimates are accurate) and \$2.99 billion (if the
12 costs instead are more in line with standard industry estimates) – it can
13 avoid at its aging and uneconomic coal plants by responsibly planning for
14 their phased retirement. By failing to evaluate the economics of its
15 existing coal plants, and continuing to operate the units, the sustaining
16 capital costs incurred at each add significantly to the undepreciated
17 balance of each plant over time.
- 18 8. The undepreciated balances of MidAmerican’s coal plants are currently
19 paid off through a revenue sharing mechanism that is not structured to
20 allow the oldest and least economic plants to have their undepreciated
21 balances paid off first. In the eyes of a utility, an undepreciated plant
22 balance may present a barrier to retirement.
- 23 9. MidAmerican’s load and resource data shows that Company can retire one
24 uneconomic coal plant immediately and will not need to procure
25 replacement capacity until [REDACTED] at the earliest, and more likely
26 [REDACTED].

27 **Q Please summarize your recommendations.**

28 **A Based on my findings, I offer the following recommendations:**

- 29 1. The Board should not make a finding that the Wind PRIME portfolio in its
30 entirety is reasonable compared to feasible alternatives based on the
31 modeling and analysis the Company has currently provided.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

- 1 2. Based on the results of our modeling, we recommend that the Board issue
2 an order modifying the Wind PRIME application to approve only the 50
3 MW of solar and roughly one third of the wind and instructing
4 MidAmerican to conduct an RFP for the 500 MW of battery storage the
5 Company will need in 2025.
- 6 3. Based on the results of our modeling, we recommend that the Board find
7 that Neal 3 is uneconomic and should be immediately retired.
- 8 4. The Board should also order MidAmerican to undertake an economic
9 analysis of all its remaining coal units to ensure MidAmerican is not
10 recovering costs from customers that are not reasonable and in ratepayer's
11 best interest. It should do this regardless of whether it approves Wind
12 PRIME. This modeling should be conducted using capacity expansion
13 modeling and should assess whether the Company's coal units should be
14 retired and replaced with additional solar, storage, efficiency, and demand
15 response. It should be carried out with Board oversight and stakeholder
16 participation in a contested case proceeding, and it should be informed by
17 a robust all-source RFP process.
- 18 5. The Board should direct MidAmerican to modify the revenue sharing
19 ratemaking principle to consider not just financing but also resource
20 economics and avoided costs in determining the order to pay off its
21 undepreciated plant balances. This will enable MidAmerican to fully
22 depreciate and retire its most uneconomic plants and avoid unnecessary
23 O&M and capex costs at those plants. Based on my analysis, I recommend
24 re-ordering the coal plants in the following order in the depreciation
25 schedule: (1) Neal 3, (2) Louisa, (3) Ottumwa, (4) Neal 4, (5) WSEC 3.
 - 26 i. As a first step, we propose that MidAmerican identify retirement
27 dates and modify the revenue sharing principles for two units –
28 Louisa and Neal 3 - to link complete depreciation of its coal units
29 to retirement and removal from rate base. These units appear to be
30 the best candidates for near-term retirement based on the results of
31 the Energy Futures Group modeling.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 **3. MIDAMERICAN HAS FAILED TO JUSTIFY THE WIND PRIME PORTFOLIO USING**
2 **APPROPRIATE QUANTITATIVE ANALYSIS IN BOTH ITS ORIGINAL APPLICATION AND IN**
3 **ITS UPDATED APPLICATION.**

4 **Q Does MidAmerican's updated application address the major concerns you**
5 **outlined in your direct testimony, mainly that the Wind PRIME proposal is**
6 **designed to maximize energy market revenue and tax credits, rather than to**
7 **demonstrate that the resources proposed are reasonable compared to feasible**
8 **supply alternatives?**

9 **A** No. The Wind PRIME project is still designed to maximize market energy
10 revenue and production tax credits (PTC). As discussed further below,
11 MidAmerican has not conducted the type of quantitative resource analysis in
12 either its original or updated application that is generally expected of a rate-
13 regulated public utility to demonstrate that the resources in Wind PRIME are
14 reasonable relative to other supply options. MidAmerican's approach with Wind
15 PRIME might be reasonable for a merchant utility, but it is not a reasonable
16 approach for a rate-regulated utility with captive ratepayers.

17 **Q What is MidAmerican proposing in its updated application?**

18 **A** MidAmerican is proposing the same portfolio of resources in Wind PRIME as it
19 did in its original application. Only the timing of resource additions has changed
20 from its original application, along with the Company's calculation of the tax
21 credits. Initially, the Company proposed building [REDACTED] of wind and 50 MW of
22 solar PV in 2023, with an additional [REDACTED] wind in 2024.¹ Now, the
23 Company proposes building [REDACTED] of wind in 2023 and [REDACTED] of wind

¹ Confidential Direct Testimony of MidAmerican Witness Jablonski, Pg. 27.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 and 50 MW of solar PV in 2024. This change in timing was spurred by changes in
2 site availability, development delays, and price increases for solar materials.²

3 **Q Why has MidAmerican updated its application?**

4 **A** MidAmerican Witness Specketer presented financial analysis that the Company
5 updated to capture the increase in PTC revenue the Company would earn on the
6 Wind PRIME project following passage of the IRA of 2022. Witness Specketer
7 confirms that “all other model inputs and assumption for Wind PRIME are the
8 same as reflected in [his] direct testimony.”³ This means that MidAmerican did
9 not update its core modeling or analysis to re-consider its proposed resource mix
10 with the substantial changes brought by the IRA.

11 **Q How does the IRA affect the Wind PRIME proposal?**

12 **A** The IRA increases the value of clean energy tax credits, extends the expiration
13 date of those credits, and increases the types of clean energy projects that can
14 qualify for those credits. These credits are available not just to the resources in
15 Wind PRIME, but also to alternatives such as specifically battery storage and
16 additional solar PV.

17 As seen in Table 1, the ITC and PTC values have increased for projects placed
18 into service in the next few years. Beyond what is depicted in Table 1, additional
19 ITC and PTC tiers have been added that entitle projects to an additional 10
20 percent tax credit adder if they meet domestic content criteria and another 10
21 percent adder if they are located in an energy community. The maximum ITC and
22 PTC credits available, therefore, are 50 percent—notably larger than when the
23 Wind PRIME portfolio was developed.

² Confidential Rebuttal Testimony of MidAmerican Witness Jablonski, Pg. 11-12.

³ Rebuttal Testimony of MidAmerican witness Specketer, Pg. 11.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 **Table 1. Clean energy tax credits before and after the IRA⁴**

	Tax credit	Quantity	Eligible energy types	Tax credit level for projects that began construction in:		
				2022	2023	2024
Pre-IRA	PTC	2.5 cents/kWh, adjusted for inflation	Wind	0%	0%	0%
	ITC	Percentage of total investment	Wind	26%	22%	10%
			Solar	26%	22%	10%
Post-IRA	PTC	2.5 cents/kWh, adjusted for inflation	Solar, Wind, Storage	100%	100%	100%
	ITC	Percentage of total investment	Solar, Wind, Storage	30% [†]	30%	30%

2 *Note: wind projects that began construction in 2021, prior to the IRA, were eligible for a 60 percent*
3 *PTC. At the time, solar projects beginning construction in 2021 were eligible for a 26 percent ITC.*

4 *[†] The 30% tax credit level assumes that prevailing wage and apprenticeship requirements are met.*

5 Further, when MidAmerican filed its original Wind PRIME proposal, the PTC
6 was unavailable for projects beginning construction after December 31, 2021, and
7 the ITC was in the process of phasing out. MidAmerican noted that the phase out
8 of the tax credits made the Wind PRIME project urgent.⁵ Now that the ITC and
9 PTC have been extended, there is no longer a pressing need to start projects as
10 soon as possible or risk losing tax credit revenues.

11 **Q What other IRA provisions could impact the Wind PRIME portfolio?**

12 **A** The IRA offers additional tax credits for solar, wind, or battery storage projects
13 located in energy communities. Any census tract where a coal mine or coal-fired

⁴ Congressional Research Service, The Energy Credit or Energy Investment Tax Credit. (2021). Available at <https://crsreports.congress.gov/product/pdf/IF/IF10479>; Congressional Research Service, Energy Tax Provisions: Overview and Budgetary Cost. (2021). Available at <https://crsreports.congress.gov/product/pdf/R/R46865>; Inflation Reduction Act of 2022, 117th congress. Available at https://www.democrats.senate.gov/imo/media/doc/inflation_reduction_act_of_2022.pdf.

⁵ Direct Testimony of MidAmerican Witness Fehr, Pgs. 6-7.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 power plant has closed since 2009 is defined as an energy community (as well as
2 the census tracts directly adjacent).

3 **Q What are the main implications of the IRA changes?**

4 **A** The IRA benefits wind by extending the existing ITC and PTC tax credits. But it
5 is even more impactful and transformative for solar PV, which now qualifies for
6 both the ITC and PTC, and for battery storage, which is now eligible for the ITC.
7 At the time of MidAmerican's initial filing, solar PV could not access the PTC
8 and battery storage was not eligible for the ITC.⁶ As I discuss below, given this
9 change, it is concerning that the Company did not evaluate whether it should not
10 include more solar and any battery storage in the Wind PRIME portfolio.

11 **Q Explain the analysis and updates that you believe MidAmerican should**
12 **include in an updated application.**

13 **A** MidAmerican never conducted any quantitative resource capacity expansion
14 modeling analysis to evaluate whether the resources in Wind PRIME were
15 reasonable relative to alternative sources of supply. So, we are not asking
16 MidAmerican to re-do its resource selection analysis; we are asking the Company
17 to do the analysis it never did to support its original application. As my previous
18 testimony advised prior to the bill's passage, the IRA's implications for energy
19 planning are significant. Now that the landmark bill has become law, new and
20 extended tax credits for wind, solar, and battery storage make it even more
21 important that the Company provides updated analysis.

22 In doing this analysis, the Company should update its resource cost assumptions
23 and evaluate whether, with the updated cost assumptions, the resources included

⁶ H.R. 5376 – 117th Congress (2021-2022): Inflation Reduction Act of 2022. Available at https://www.democrats.senate.gov/imo/media/doc/inflation_reduction_act_of_2022.pdf.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

in its proposed Wind PRIME portfolio are reasonable when compared with alternatives. This includes examining whether it would be in ratepayers' interest to add more solar PV and battery storage resources to its system, rather than more wind. In conducting the analysis, MidAmerican should examine not only the base-level PTC and ITC assumptions, but also the 10 percent PTC adder available for clean energy projects located in energy communities. [REDACTED]

[REDACTED]

[REDACTED].⁷

As part of this analysis, the Company should update its market prices for the eastern interconnect to reflect the downward pressure that the IRA will have on the MISO energy market prices. Specifically, as the IRA lowers the cost to build zero marginal cost renewables, more clean energy resources will be deployed on the grid. As MidAmerican itself has shown with the impact of Wind PRIME on market prices, the introduction of more renewables on the grid is likely to lower market prices over the long term. This will benefit customers through lower electricity prices but will also reduce the revenue that MidAmerican's existing assets – including both coal and existing wind – can be expected to generate. The Company acknowledged it did not update its market prices.⁸ These updated market price forecasts are needed to evaluate the net revenues the proposed projects would generate with greater accuracy.

Q Have other utilities updated or conducted resource planning to address the IRA?

A Yes. For example, in Michigan, DTE recently filed an Integrated Resource Plan that incorporated the benefits of the IRA. That plan included 4,400 MW of solar,

⁷ Glick Direct Exhibit 32, Confidential MidAmerican Response to EI DR 166 (c).

⁸ Glick Direct Exhibit 32, Confidential MidAmerican Response to EI DR 152 (a).

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 1,000 MW of wind and 760 MW of battery storage in the next decade. In
2 addition, the plan moved the retirement of four coal units from 2040 up to 2028
3 and 2035.⁹ This is consistent with the type of results we would expect to see if
4 MidAmerican did actual quantitative analysis to inform its resource additions.

5 **Q Briefly explain the modeling that MidAmerican used to select Wind PRIME**
6 **in its original application.**

7 **A** As I discussed in my direct testimony, the qualitative analysis MidAmerican used
8 to support its Wind PRIME application was somewhat arbitrary and subjective
9 and is inconsistent with best practices used throughout the utility industry for
10 selecting resource additions. MidAmerican did not utilize industry best-practices
11 to quantitatively examine its resource additions from a resource adequacy
12 perspective or to justify the decision to invest so heavily in wind over solar PV.
13 Instead, the Company appears to have selected the Wind PRIME resource
14 portfolio outside of any apparent analytical process, selecting a portfolio that
15 favored wind over solar PV because wind resources deliver higher PTC revenues.
16 The Company then applied Company Witness Hammer applied a “nine-factor
17 analysis” framework (created by the Company) after the fact to justify the
18 decision. But a regulated public utility should not be approaching new resource
19 addition decisions solely from the perspective of maximizing tax or energy
20 revenues. A utility acting the best interest of its ratepayers should consider other
21 resource attributes and values in making addition decisions; this is what capacity
22 expansion modeling is designed to do.

23 Company Witness Specketer presented several pieces of financial analysis that
24 supposedly demonstrated the value of Wind PRIME. These analyses covered

⁹ Ethan Howland, “DTE Electric proposes \$9B spend on 5.4 GW renewables, 760 MW storage, coal-to-gas power plant switch.” Utility Dive, November 4, 2022. Available at [utilitydive.com/news/dte-energy-resource-plan-irp-solar-coal-michigan-psc/635781/](https://www.utilitydive.com/news/dte-energy-resource-plan-irp-solar-coal-michigan-psc/635781/).

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 MidAmerican's projections of Wind PRIME's project economics, net system
2 benefits, revenue requirements, and impact on revenue sharing. But the Company
3 did not present any analyses preceding the development of the Wind PRIME
4 portfolio to demonstrate that it compared its proposal to other reasonable resource
5 additions.

6 The only analyses MidAmerican provided that predate the Wind PRIME filing
7 were the "Zero Emissions Study," which [REDACTED]
8 [REDACTED] and the Siemens study, [REDACTED]
9 [REDACTED]. I will discuss these studies
10 in more detail in section 4 below.

11 **Q Did MidAmerican address any of these concerns in its updated application?**

12 **A** No. In the updated application, the company upholds its previous, qualitative
13 nine-factor analysis but still does not demonstrate that the selected amount of new
14 wind and solar PV in the Wind PRIME portfolio represents a cost-effective or
15 reasonable portfolio of resource additions compared to any other available
16 renewable options.¹⁰

17 If MidAmerican had used quantitative analysis in its original application to
18 demonstrate the reasonableness of the Wind PRIME portfolio, it could have easily
19 updated its modeling once the IRA passed to evaluate whether the additional tax
20 credits made its original portfolio more or less reasonable and economic
21 compared with alternatives. But the absence of any quantitative resource planning
22 analysis in either its original or updated application means that it is unknowable
23 based on the Company's analysis whether there are alternative resource portfolios
24 that are more economic or reasonable than Wind PRIME, inclusive of the IRA
25 impacts. This is why Synapse, in collaboration with Energy Futures Group,

¹⁰ Rebuttal Testimony of MidAmerican Witness Hammer, Pg. 2.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 conducted our own updated analysis to evaluate whether Wind PRIME is
2 reasonable compared to alternatives, inclusive of IRA impacts. I present the
3 results of this analysis in Section 5 below.

4 **Q The IRA improved the economics of Wind PRIME, so why is it still critical to**
5 **evaluate the resources in Wind PRIME relative to alternatives?**

6 **A** With the ITC and PTC increased and extended, Wind PRIME may well still
7 achieve its intended goal—maximizing tax credit revenue—but that does not
8 mean that the IRA renders the Wind PRIME proposal reasonable when compared
9 to other feasible alternative sources of supply. On the flip side of maximizing
10 revenues and tax credits is minimizing total resource portfolio costs to customers,
11 and there is no evidence that this portfolio does that (or that it even achieves
12 reasonable costs compared to alternatives). As I explained in my initial testimony,
13 approaching resource additions from the perspective of maximizing energy
14 revenues neglects key planning obligations, mainly minimizing costs, minimizing
15 risk, and ensuring long-term resource adequacy. And as I will discuss below, coal
16 resource studies performed recently for MidAmerican also indicate the need to
17 incorporate quantitative resource planning into MidAmerican's portfolio
18 development.

19 **Q How does MidAmerican defend the lack of resource planning modeling in its**
20 **Wind PRIME application?**

21 **A** Witness Hammer argues that conducting capacity expansion modeling is not
22 required or even useful;¹¹ I emphatically disagree. Capacity expansion modeling
23 is required to demonstrate that the resource portfolio that MidAmerican is
24 proposing ensures resource adequacy and meets system constraints at reasonable

¹¹ Rebuttal Testimony of MidAmerican Witness Hammer, pg. 2.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 cost when compared with alternative resource options and portfolios.
2 MidAmerican never conducted this analysis in its original application. Nor did it
3 determine how the IRA tax changes would affect the reasonableness of the
4 resources included in Wind PRIME compared to alternatives. In the absence of
5 any updated analysis, the resource mix included in Wind PRIME remains
6 unchanged, as does MidAmerican's plan to maintain its current coal fleet as part
7 of Wind PRIME. The Company's assumption that it will rely on its aging coal
8 plants to support the wind in Wind PRIME is a critical and serious issue that the
9 Company glosses over in its application. I discuss this in detail in the next section.

10 **4. MIDAMERICAN'S ANALYSIS OF THE BENEFITS OF THE WIND PRIME PORTFOLIO**
11 **RELIES ON MIDAMERICAN'S AGING COAL RESOURCES FOR CAPACITY,**
12 **OVERLOOKING THE SIGNIFICANT COSTS THAT COULD BE AVOIDED BY**
13 **TRANSITIONING AWAY FROM THOSE RESOURCES AND REPLACING THEM WITH**
14 **ALTERNATIVES.**

15 **Q How are the coal plants relevant to Wind PRIME planning and approval?**

16 **A** The Company proposes the Wind PRIME portfolio based on maximizing energy
17 revenues and tax credits, and otherwise assumes that it can continue relying
18 heavily on its aging coal plants to meet the capacity needs of its system.
19 Specifically, MidAmerican assumes its coal plants will remain online through
20 their planned retirement dates as part of Wind PRIME. But the Company provides
21 no analysis as part of its application to support the reasonableness of this
22 assumption or to evaluate the costs of maintaining its aging coal plants relative to
23 alternative supply options. The Company did, however, provide two studies from
24 2019 and 2020 that evaluated retirement and replacement of its coal plants with
25 alternatives. I will summarize the findings from these studies below.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

Second, the tax credits and energy revenues from Wind PRIME will increase the revenue sharing available to MidAmerican. Revenue sharing is one tool that MidAmerican uses to pay down the undepreciated balance of its coal generation assets. But the order in which MidAmerican currently pays down its coal plants' undepreciated balances does not prioritize paying off first the plants that are the costliest to operate and maintain – that is, the plants that have the highest variable operations costs and fixed O&M costs, and require the largest sustaining capital expenditures. And the longer the Company's costly coal plants stay online, the more avoidable O&M and capex costs they will incur.

MidAmerican's analysis in support of the Wind PRIME project neglects a significant category of costs on which the project relies: the substantial avoidable O&M and capex costs necessary to maintaining its coal plants, [REDACTED]

i. MidAmerican's analysis in support of the Wind PRIME project neglects the substantial avoidable O&M and capex costs necessary to maintain its coal plants, [REDACTED]

Q How much coal capacity does MidAmerican plan to rely on as part of Wind PRIME?

A As discussed on pages 12–13 of my direct testimony, coal accounts for just under half of MidAmerican's firm capacity. The Company made no changes to the retirement dates of its coal fleet (shown in Table 2 below) as part of its updated application, and still plans to rely on most units through at least [REDACTED].¹²

32, Confidential MidAmerican Response to EI DR. 47C.

5

Q Does MidAmerican need the capacity from all its coal plants to meet load?

6

A No. MidAmerican's own load and resource data, presented in Table 3 of Company Witness Hammer's direct testimony, shows that MidAmerican has a capacity surplus until at least . This means MidAmerican can retire one of its uneconomic coal units without a capacity shortfall until  at the earliest, and more likely .

10

11

Q Why does MidAmerican's preservation of this retirement schedule in its updated application concern you?

12

13

A Generally, coal plants are expensive to operate and are trending toward earlier retirement in the United States while renewable costs are falling. Between 2016 and 2020, around 11 GW of coal retired each year in the United States. Although the levels dropped to 4.6 GW in 2021, an additional 12.7 GW of coal generation

14

15

16

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 is scheduled to retire in 2022.¹³ Looking beyond 2022, S&P Global Market
2 Intelligence reports that 51 GW of coal power is scheduled to retire between 2022
3 and 2027, with an additional 23 GW of retirements coming in 2028.¹⁴

4 Coal plants like MidAmerican's require substantial spending on O&M and
5 sustaining capital costs to continue to operate, which can be costly and tends to
6 increase as plants age. Just the costs to continue to maintain coal plants
7 increasingly exceed the cost of building and operating new clean energy resources
8 such as wind, solar and battery storage. These costs are entirely avoidable if the
9 coal plants retire.

10 **Q Which costs are avoidable, and did MidAmerican include these in its**
11 **analysis?**

12 **A** There are two main categories of potentially *avoidable* costs associated with
13 operating MidAmerican's aging coal fleet: fixed O&M and sustaining capital
14 expenditures. As discussed above, MidAmerican has not considered the benefits
15 of a resource portfolio that avoids these forward-going operating costs at its coal
16 plants and therefore did not include any of these avoidable costs in its Wind
17 PRIME analysis.

¹³ U.S. Energy Information Administration, *Coal Will Account for 85% of U.S. Electric Generating Capacity Retirements in 2022* (January 11, 2022), available at <https://bit.ly/3MPZ4KE>.

¹⁴ Darren Sweeney et al., *More than 23 GW of Coal Capacity to Retire in 2028 as Plant Closures Accelerate*, S&P Global Market Intelligence (February 2022), available at <https://bit.ly/3vzVpKL>.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 **Q How much does MidAmerican project it will cost to maintain its coal fleet on**
2 **a forward-going basis, and do those cost projections seem reasonable?**

3 **A**Even though the Company did not consider these costs in its Wind PRIME
4 analysis, it still prepares cost projections for other system planning purposes. And
5 based on these cost projections, the Company appears to be substantially
6 underestimating the magnitude of fixed O&M and sustaining capital costs
7 required to maintain its coal units, relative to industry standards and historical
8 data (which was available only for sustaining capital expenditures).

9 MidAmerican's expectation of future fixed O&M costs at its coal plants are
10 substantially lower than industry estimates produced by Sargent & Lundy for the
11 U.S. Energy Information Administration (EIA) for units of similar sizes and ages.
12 I present this comparison in Glick Exhibit 33, Appendix A of my testimony,
13 Table A1(average annual spend \$/kW) and Table A2 (lifetime NPV). This is
14 concerning because it means that the fixed O&M costs MidAmerican is using for
15 other confidential internal planning purposes—and which it should be using in
16 assessing the value of its Wind PRIME proposal—appear to be systematically
17 understated.

18 Similarly, it appears that MidAmerican also may be underestimating the required
19 sustaining capital expenditures at five of its six coal units. As shown in Appendix
20 A, Table A3 (average annual spend \$/kW) and Table A4 (lifetime NPV), the
21 difference in projected capital costs between the Company's projections and
22 Sargent and Lundy's estimates for life-extending capital investments at coal
23 plants of similar age and size amounts to tens to hundreds of millions of dollars
24 over the lifetime of each plant.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 **Q What does this work out to on a total cost basis?**

2 **A** As shown in Table 3, I estimate, based on publicly available industry estimates of
 3 the costs to maintain coal units of similar size and age to MidAmerican's, that the
 4 Company could spend as much as \$1.66 billion on fixed O&M and \$1.32 billion
 5 on capex costs for a total of \$2.99 billion over the remaining life of its coal fleet.
 6 And this is not even considering fuel and other variable costs incurred to operate
 7 the plans. But MidAmerican projects it will spend only [REDACTED] in fixed
 8 O&M costs and [REDACTED] on capex for a total of only [REDACTED]. The
 9 Company's projections are [REDACTED] what I would expect based on
 10 industry averages.

11 **Table 3: Confidential Cost comparison of total forward going fixed O&M and capex**
 12 **spending at MidAmerican's coal fleet (\$2021 Million)**

Coal Plant	Total fixed O&M	Total sustaining capex	Total cost
Sargent and Lundy report based on plant size, age, and flue gas desulfurization status	\$1,666	\$1,326	\$2,992
Average of 2022 to scheduled retirement year	[REDACTED]	[REDACTED]	[REDACTED]

13 *Source: Glick Exhibit 32, Confidential MidAmerican Response to EI DR. 47C; Sargent and Lundy,*
 14 *"Generating Unit Annual Capital and Life Extension Costs Analysis" (2019). Available at*
 15 *https://www.eia.gov/analysis/studies/powerplants/generationcost/pdf/full_report.pdf. Public direct testimony of*

 17 *[https://wcc.efs.iowa.gov/cs/idcplg?IdcService=GET_FILE&dDocName=1776607](https://wcc.efs.iowa.gov/cs/idcplg?IdcService=GET_FILE&dDocName=1776607&allowInterrupt=1&noSaveAs=1&RevisionSelectionMethod=LatestReleasede)*
 18 *[https://wcc.efs.iowa.gov/cs/idcplg?IdcService=GET_FILE&dDocName=1776607](https://wcc.efs.iowa.gov/cs/idcplg?IdcService=GET_FILE&dDocName=1776607&allowInterrupt=1&noSaveAs=1&RevisionSelectionMethod=LatestReleasede)*
 19 *&allowInterrupt=1&noSaveAs=1&RevisionSelectionMethod=LatestReleasede. Glick Exhibit 34, DG Confidential Workpaper 1.*

20 This difference shows the risk of locking in reliance on coal plants: the potential
 21 for substantially higher costs than MidAmerican has estimated. But regardless of
 22 whether it is \$2.99 billion, [REDACTED], or somewhere in between, these are costs
 23 that MidAmerican is not considering in its evaluation of the Wind PRIME
 24 proposal. This is true even though MidAmerican's focus on maximizing energy
 25 revenues from its wind buildout creates dependency on the coal plants for meeting
 26 capacity needs.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 **Q** **Did MidAmerican’s updated proposal examine any resource portfolios that**
2 **quantify the benefits of facilitating the retirement of its most expensive coal**
3 **plants?**

4 **A** No. As I have stated, MidAmerican’s updated application does not examine
5 whether adding Wind PRIME would enable any early coal retirements despite the
6 potential that they may soon be fully depreciated and the magnitude of the
7 avoidable costs. This is particularly concerning given that even before the IRA
8 passed, MidAmerican’s analysis showed that the undepreciated balances at its
9 coal plants [REDACTED].¹⁵

10 **Q** **What do you conclude regarding MidAmerican’s lack of planning around a**
11 **reasonable retirement plan for its coal fleet?**

12 **A** I do not expect or recommend that MidAmerican retire 100 percent of its coal
13 fleet in short order; the transition will take time. But MidAmerican needs to plan
14 for the transition and to better understand the steps it should take now to facilitate
15 this transition, as other utilities around the country are doing. This should include
16 analyzing, through capacity expansion modeling, which resource additions will
17 position the utility to retire its uneconomic coal plants. MidAmerican’s omission
18 of additional analysis of an optimal coal plant retirement schedule deviates from
19 standard regulated utility practice and fails to demonstrate that Wind PRIME is a
20 reasonable portfolio of additions relative to alternatives.

21 **ii. MidAmerican conducted two studies between 2019 and 2021 that evaluated the**
22 **economics of retiring its coal fleet and replacing the units with alternative**

¹⁵ Glick Exhibit 24, MidAmerican Response to EI DR 35, Confidential Attachment.

1 supply options; the results [REDACTED] the need for MidAmerican to [REDACTED]
2 [REDACTED]

3 **Q Has MidAmerican conducted other recent economic analysis of its coal fleet**
4 **and its fleet's role in the Company's long-term resource plan?**

5 **A Yes.** MidAmerican conducted two studies recently that evaluated retirement of its
6 existing coal units. The first was a Zero Emissions Study conducted internally by
7 MidAmerican in March 2019.¹⁶ The Zero Emissions Study [REDACTED]
8 [REDACTED]
9 [REDACTED]
10 [REDACTED] The second was a study conducted by Siemens in February 2020.¹⁷ The
11 Confidential Siemens study [REDACTED]
12 [REDACTED]

13 Neither study robustly evaluated retirement relative to replacement with
14 alternatives. But the findings and recommendations from the studies do
15 nonetheless support the need for MidAmerican to regularly conduct robust
16 resource replacement analysis.

17 **Q What was the scope of the Zero Emissions Study?**

18 **A** [REDACTED]
19 [REDACTED]

¹⁶ Confidential Zero Emissions Study (ZES), MidAmerican Energy Company. March 1, 2019 (filed with the Board October 20, 2022).

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 [REDACTED]
2 [REDACTED]

3 **Q Did MidAmerican present any evidence that it used the results of the Zero**
4 **Emissions Study or the Siemens Study as a comparison of a feasible**
5 **alternative to the Wind PRIME proposal?**

6 **A** No. These studies are not mentioned anywhere in its application. MidAmerican
7 only acknowledged the existence of the studies and specified what they were after
8 it lost a motion to compel filed by Environmental Intervenors.³³ MidAmerican
9 only provided these studies after Environmental Intervenors filed another motion
10 to compel with the Board.³⁴

11 **Q What did these studies reveal about MidAmerican's coal plants?**

12 **A** Despite their substantial deficiencies, both studies concluded that [REDACTED]
13 [REDACTED]
14 [REDACTED] and that the Company should conduct follow-up analysis. Specifically,
15 the internal studies suggest that MidAmerican should: [REDACTED]
16 [REDACTED]
17 [REDACTED]

18 **Q What did the studies recommend for next steps?**

19 **A** Both studies [REDACTED]. Specifically, the
20 Siemens study concluded that [REDACTED]

³³ Order Granting in Part and Denying in Part Environmental Intervenors' Motion to Compel (filed July 13, 2022); EI DR 20 Attachment (filed July 21, 2022).

³⁴ Motion to Compel (filed Sept. 2, 2022).

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 [REDACTED]
2 [REDACTED]
3 [REDACTED]

4 The Zero Emissions Study noted that a key area for future study would be [REDACTED]
5 [REDACTED]
6 [REDACTED]
7 [REDACTED]
8 [REDACTED] This is consistent with what I recommended in my
9 direct testimony and why Synapse and Energy Futures Group conducted our own
10 analysis that I will discuss in Section 5.

11 *iii. MidAmerican should use revenue sharing to pay off the undepreciated balances*
12 *of uneconomic coal units first.*

13 **Q Please explain this revenue sharing mechanism in more detail.**

14 **A** The Board approved the revenue sharing mechanism in the 2013 rate proceeding
15 (the mechanisms was then modified by the Rate Mitigation ratemaking principle
16 approved in Wind XII).³⁷ MidAmerican uses revenue sharing in place of rate
17 cases to pay down the undepreciated balances of its existing generators. Revenue
18 sharing from prior wind projects has already accelerated the depreciation of its
19 coal plants substantially.³⁸

³⁵ Confidential Siemens, Pg. 12.

³⁶ Confidential ZES, Pg. 15.

³⁸ Glick Confidential Exhibit 24, MidAmerican Confidential Response to EI DR 35, a, b, c; Glick Confidential Exhibit 32, Confidential Response to EI DR 174.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 **Q How does the IRA change the Company's revenue sharing projections?**

2 **Q** As shown in Table 4 below, prior to the passage of the IRA, MidAmerican
 3 projected that Wind PRIME would substantially reduce revenue sharing. This
 4 would in turn reduce the rate at which MidAmerican could pay down the
 5 undepreciated value of its coal plants. This clearly shows that the Company's
 6 original intention for the project was to maximize tax credits and energy market
 7 revenues for itself, not to deliver increased revenue sharing to ratepayers.

8 But MidAmerican and its ratepayers fortuitously benefit from passage of the IRA.
 9 The Company now expects Wind PRIME will increase revenue sharing by [REDACTED]
 10 on an NPV basis relative to before the IRA.³⁹

11 **Table 4: Confidential Wind PRIME revenue sharing pre and post IRA (2022–2030)**
 12 **(\$2021 Million)**

Revenue sharing	NPV Revenue sharing	NPV Delta from without Wind PRIME
Without Wind PRIME	[REDACTED]	[REDACTED]
With Wind PRIME (pre-IRA)	[REDACTED]	[REDACTED]

Source: Glick Exhibit 24, MidAmerican Response to EI 35, Confidential Attachment; MidAmerican Response to EI 174, Confidential Attachment; Glick Direct Exhibit 41, DG Confidential Workpaper 8.

Q Is the existence of undepreciated book value of the coal plants an economic barrier to retirement?

A No. Current undepreciated balances on the coal plants are what are known in economics as “sunk costs”—that is, they are costs that must be paid regardless, and so should not be considered in forward-looking decision-making. Economical retirement choices should reflect only the going-forward costs of operating the coal plants, including fuel, O&M, and any required capital expenditures, compared to alternatives providing an equivalent amount of energy and capacity. Regardless of how MidAmerican pays down the undepreciated balances, or how fast they pay those down, or through which mechanisms (including the revenue sharing mechanism), MidAmerican’s ratepayers will still be better off if uneconomic coal plants are retired as early as indicated based on an appropriate economic-driven capacity expansion analysis (or similar analytical exercise). Such an analytical exercise would account for the value ratepayers receive from MidAmerican investment in less expensive sources of energy and capacity and avoidance of the uneconomic costs of coal plant operation.

While undepreciated balances should not rationally be considered in making retirement decisions, utilities often express concern that the undepreciated balances on retired generators will be considered no longer “used and useful” and

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 therefore will be disallowed from recovery. Undepreciated balances thus can
2 become a barrier to utilities supporting coal retirement in a regulatory context.

3 **Q Can you explain how the revenue sharing mechanism is currently**
4 **structured?**

5 **A**The structure prioritizes the allocation of revenue sharing dollars to each coal
6 plant according to which plant has the highest return on equity (ROE)—in other
7 words, based upon which has the highest interest rate.⁴¹ This allocation
8 methodology does not take into account which plants are the costliest to maintain
9 and therefore have the largest avoidable costs in the form of O&M and sustaining
10 capital costs.

11 The current prioritization would make sense if the balances on each plant were
12 static, and the operating costs were lower than alternatives, but crucially they are
13 not. As an example, if a trucking company has financed two trucks and the
14 interest rate on one truck is higher, it would appear rational for the company to
15 pay off the truck with the higher rate first. But if the truck with the lower interest
16 rate had significantly worse fuel efficiency and required more frequent and costly
17 regular maintenance and repairs and more cost effectively could be replaced with
18 a newer more efficient model, it would change the overall calculus about which
19 truck to pay down first.

20 **Q What would result in the best outcome for ratepayers?**

21 **A**The best outcome for ratepayers involves a two-step process, separately
22 addressing sunk costs and going-forward operating costs. MidAmerican should
23 first retire those plants that are uneconomic (based on an analysis of going-

⁴¹ The current order of accelerated depreciation is listed in the Board's Wind XII decision. Docket No. RPU-2018-0003, "Final Order and Decision" (filed Dec. 4, 2018) at 25-26.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 forward costs) and replace their energy and capacity with less expensive
2 resources. Next, MidAmerican can reorder the pay-off schedule to pay down
3 undepreciated plant balances based on financing considerations and the funds
4 available from the revenue sharing mechanism.

5 **Q If the IRA increases revenue sharing and enables the project to be built at**
6 **“no net cost,” explain why that isn’t sufficient justification for this project.**

7 **A** Just because Wind PRIME produces large energy market revenues and PTC value
8 does not mean it is a reasonable portfolio. Just as important as revenue
9 maximization is cost minimization (or, at least, demonstrating that the costs are
10 reasonably lower than other feasible alternatives). By committing \$4 billion⁴² to
11 the Wind PRIME project, MidAmerican may be making it more challenging to
12 commit shareholder and ratepayer dollars to a different set of resource additions
13 that would (1) achieve greater cost savings to customers and (2) better position
14 the utility to advance towards the goal it says customers are demanding: true
15 carbon-free electricity.

16 The Company incurs high costs to maintain its aging coal units; these costs are
17 avoidable if a plant retires and is replaced by lower cost resources such as solar
18 PV and battery storage. These potential avoided costs are significant, as discussed
19 further below; but they are completely neglected by MidAmerican’s myopic
20 financial analysis, which focuses narrowly on maximizing energy revenue from
21 new resource additions.

22 Additionally, MidAmerican bases the value of the project on the assumption that
23 (1) the wind projects generate at the projected capacity factors; (2) market prices
24 stay at the high levels projected; and (3) a carbon price is instituted. Company
25 witness Specketer admitted as much in direct testimony, stating that “customer

⁴² Direct Testimony of Company Witness Brown, Pg. 3.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 bear the risk that electricity market prices are lower than forecasted (although they
2 would enjoy the benefits of market prices that are higher than forecasted), and that
3 Wind PRIME will not operate as modeled.”⁴³ He also admitted that customers
4 will bear the risk of a rate increase in the future if the Project does not perform as
5 expected or if electricity market prices do not materialize as forecasted.⁴⁴
6 Effectively, MidAmerican is acting like an investor merchant generator, using
7 ratepayers as a backstop and guarantor if the economics of its investment do not
8 pan out.

9 **Q Can you briefly explain what MidAmerican means when it says it can build**
10 **Wind PRIME at “no net cost.”**

11 **A** The Company means that, according to its own calculations, the projected
12 benefits from the project exceed its projected costs. As shown in Table 6 below,
13 MidAmerican assigns five categories of credit and benefits to the Wind PRIME
14 project: ITC, PTC, renewable energy credits, capacity sales and net system
15 benefits.⁴⁵ “Net system benefits” represent the largest portion of Wind PRIME
16 benefits and make up [REDACTED] of the value MidAmerican attributes
17 to Wind PRIME.

⁴³ Direct Testimony of Company Witness Specketer, Pg. 39.

⁴⁴ Direct Testimony of Company Witness Specketer, Pg. 42.

⁴⁵ Specketer Confidential Rebuttal Exhibits 1-4.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

Table 6: Confidential Wind PRIME credits and benefits based on Specketer Rebuttal Exhibit 4

Credits and Benefits (\$/kWh)	2023 Wind	2024 Wind	2023 Solar 50MW	Total	Percent of total credits & benefits
Total cost					
Investment tax credit					
Production tax credit					
REC credit					
Capacity sales					
Net system benefits (change in net off-system purchases & fuel costs)					

Source: Calculated based on Specketer Rebuttal Exhibit 4; Glick Direct Exhibit 36, DG Confidential Workpaper 3.

As shown in Table 7 below, net system benefits⁴⁶ reflect the impact of lower market prices expected to result from Wind PRIME on (1) energy market revenues and variable costs from MidAmerican's existing resources and (2) MidAmerican's "load expense," that is the cost to serve MidAmerican's load based on MISO location marginal pricing (LMP).⁴⁷ MidAmerican forecasts that revenues from its existing fossil units will fall with lower market prices under Wind PRIME (although revenues from its existing renewables are expected to rise over the long term). But load expenses are also expected to decrease, and that reduction is expected to be around three times as large as the decrease in revenues from the Company's existing plants. The difference between the reduction in load expense and the reduction in energy market revenues for MidAmerican's existing resources is the net system benefits. These are benefits that will flow to customers regardless of who owns the Wind PRIME projects.

Source: MidAmerican Response to Tech Customers 61a, Confidential Attachment; Glick Direct Exhibit 36 DG Confidential Workpaper 4.

Q Is it true that MidAmerican’s customers will not benefit from Wind PRIME unless they own it?

A No. The implication that MidAmerican’s ratepayers will not benefit if another entity builds the projects is false. MidAmerican acknowledges that the wind resources proposed in Wind PRIME will likely be built regardless of whether MidAmerican builds them or another party does.⁴⁸ It is true that the direct tax credits will not be passed on to MidAmerican ratepayers if the developers are “out of state entities or customers of other utilities.”⁴⁹ But the expected decrease in market prices and corresponding decrease in net system benefits discussed above, including the change in load expense, should happen regardless of whether MidAmerican or another party owns the projects currently proposed in Wind PRIME. **That means that [REDACTED] the value that MidAmerican is currently attributing to Wind PRIME will be realized regardless of whether**

⁴⁸ See, Rebuttal Testimony of Company Witness Hammer, Pg. 14; Rebuttal Testimony of Company Witness Fehr, Pgs. 7-8; Direct Testimony of Company Witness Brown, Pg. 11.

⁴⁹ Rebuttal Testimony of Company Witness Hammer, Pg. 14.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 **MidAmerican or another entity builds the projects.** The category of net system
2 benefits should therefore be excluded from the Company's calculations.

3 **5. ENERGY FUTURES GROUP'S MODELING SHOWS THAT A MORE BALANCED**
4 **PORTFOLIO OF RESOURCE ADDITIONS WHICH INCLUDES MORE SOLAR AND BATTERY**
5 **STORAGE RESOURCES, AND RETIRES UNECONOMIC COAL PLANTS, IS LOWER COST**
6 **AND PROVIDES MORE ROUND-THE-CLOCK CLEAN ENERGY THAN THE COMPANY'S**
7 **WIND PRIME PORTFOLIO AS CURRENTLY PROPOSED.**

8 **Q Explain the modeling you have performed for this docket.**

9 **A**Energy Futures Group, in collaboration with Synapse, performed capacity
10 expansion and production cost modeling using MidAmerican's own data,
11 obtained through discovery. We also supplemented that data with publicly
12 available data where necessary. Our goals were to compare MidAmerican's
13 proposed plan of action—adding Wind PRIME and continuing to run its coal
14 units until at least 2039—to a reasonable and feasible set of alternatives. This
15 includes clean energy resource additions combined with retirement of certain
16 uneconomic coal units. We sought to determine whether an alternative set of
17 additions would result in greater cost savings to customers.

18 Full details on the modeling methodology are presented in the Direct Testimony
19 of Environmental Intervenors Witness Chelsea Hotaling.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 *i. MidAmerican's dismissal of industry standard capacity expansion modeling is*
2 *concerning and unfounded*

3 **Q Has MidAmerican performed capacity expansion modeling for this docket?**

4 **A** No. MidAmerican claims that capacity expansion modeling isn't necessary or
5 sufficient.⁵⁰ Specifically, MidAmerican asserts that: "Capacity optimization
6 software oversimplifies many complex issues and is not capable of considering
7 some issues or uncertainty in the future"⁵¹ around the energy transition and
8 broader regional forces. But I disagree with the Company's assessment. Capacity
9 expansion modeling is an industry standard resource planning tool. When you
10 feed the results of the capacity expansion plan into the production cost models,
11 the model simulates the operation of a portfolio on a chronological 8,760-hour
12 basis in each year of the planning period specified in the model. The fact that a
13 model makes simplifying assumptions is not reason to discount it, but rather to
14 test multiple scenarios and sensitivities to better understand risks and
15 uncertainties.

16 **Q What type of analysis does the Company recommend instead?**

17 **A** The Company prefers its nine-factor analysis, stating that: "Resource optimization
18 software can provide some insight into such questions, but such software will
19 need to be augmented by other analyses, such as the nine-factor analysis."⁵² But
20 this nine-factor qualitative analysis oversimplifies many complex issues to a far
21 greater degree and is only as capable of considering uncertainty as the person
22 performing it. The nine-factor analysis analyzes the relative benefits of a pre-
23 selected quantity of a certain resource. Resource optimization software, on the

⁵⁰ Id. Pg. 2.

⁵¹ Id. Pg. 13.

⁵² Id. Pg. 16.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 other hand, uses mathematical algorithms to determine the optimal resource
2 quantity to examine.

3 **Q What are MidAmerican’s specific concerns about the ability for capacity**
4 **expansion modeling to capture the energy transition and broader regional**
5 **forces?**

6 **A** MidAmerican states that “Any value derived from modeling for an optimal
7 resource mix is limited at best because modeling cannot currently capture the
8 operational complexities created by industry-wide transition to renewable
9 resources, MISO’s increased focus on year-round resource adequacy, and the
10 need for dispatchable units to provide ramping and balancing functions.”⁵³ This is
11 generally not correct; utilities and regional transmission operators (RTO)
12 nationwide use modeling that respects resource adequacy requirements and
13 dispatchability (ramp rate parameters and inclusion of operating reserve
14 requirements are inherent parts of such modeling exercises). While it is true that
15 there are many complexities and uncertainties in the industry right now, these can
16 be assessed by conducting sensitivities and risk assessment. And these same
17 market uncertainties behind MidAmerican’s claim that optimal resource modeling
18 is limited in value also affect MidAmerican’s energy price forecasts modeling,
19 which it relied on for its analysis of the projected benefits from Wind PRIME.
20 Finally, as discussed above, [REDACTED]
21 [REDACTED]
22 [REDACTED].

⁵³ Rebuttal Testimony of Company Witness Brown, Pg. 10.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 ii. **Energy Futures Group’s modeling improves upon Synapse’s prior modeling by**
2 **using Company-specific data and updated assumptions**

3 **Q Please explain how this modeling differs from the Synapse modeling**
4 **referenced in your initial direct testimony.**

5 **A This new Energy Futures Group modeling differs in several key respects from the**
6 Synapse modeling I attached to my initial direct testimony. These relate mainly to
7 data availability, changes in the market, and new resources considered.

8 First, this new modeling focuses on MidAmerican’s service territory alone and
9 relies on confidential, company-specific data. The previous Synapse modeling
10 was developed without the use of confidential data from MidAmerican, which
11 was unavailable at the time. Using MidAmerican’s data on resources’ fixed costs,
12 sustaining capital costs, load, energy prices, carbon price, heat rates, and other
13 inputs allows us to perform the type of modeling we expect of a rate-regulated
14 public utility like MidAmerican.

15 Second, there have been a lot of changes in the markets over the last year since
16 we conducted the Synapse modeling. Capacity market prices in MISO’s “spot”
17 planning resource auction jumped from \$5/MW-day in the 2021/2022 auction to
18 \$233.66/MW-day in the 2022/2023 auction.⁵⁴ There have been considerable
19 volatility and price increases in the natural gas market (driven partially by the war
20 in Ukraine), resulting in high energy market prices at least in the near term. The
21 Covid 19 pandemic has caused supply chain challenges and near-term inflation
22 that the economy has still not recovered from. And most significant is the recent
23 passage of the IRA. The IRA provides substantial tax credit extension and new
24 tax credits for new solar PV, wind, and battery storage projects which were not

⁵⁴ 2022/2023 Planning Resource Auction (PRA) Results, Pg. 15. Available at
<https://cdn.misoenergy.org/2022%20PRA%20Results624053.pdf>.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 available at the time we conducted the prior analysis. These tax credits more than
2 counter the near-term impacts of inflation and supply chain delays, all of which
3 we incorporated into our updated modeling.

4 Third, MidAmerican had not proposed Wind PRIME at the time we conducted
5 our modeling, so we did not model the Wind PRIME portfolio in the original
6 Synapse analysis.

7 ***iii. Modeling methodology***

8 **Q Please describe the methods and software you used to model alternative**
9 **portfolios for MidAmerican.**

10 **A** Our modeling was performed using EnCompass, an optimized capacity expansion
11 and production cost model developed by Anchor Power Solutions, to simulate
12 resource choice impacts in MidAmerican's service territory.

13 **Q Is EnCompass a widely accepted industry model?**

14 **A** Yes. EnCompass is an industry-standard model used to develop the least-cost
15 portfolio capable of meeting system constraints. Released in 2016, EnCompass is
16 now used by major utilities such as Xcel Energy (Colorado, Minnesota, and New
17 Mexico), Minnesota Power, Otter Tail Power, Public Service New Mexico, Duke
18 Energy, and Tennessee Valley Authority, among others. It is similar to Aurora, a
19 model I understand parties may have more familiarity with.

20 **Q Please describe your role in this modeling.**

21 **A** I supported Chelsea Hotaling at Energy Futures Group through the entire
22 modeling process. I assisted in the selection of inputs data, development of

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 modeling assumptions, design of scenarios and sensitivities, and review of
2 modeling results.

3 **Q What scenarios did you model?**

4 **A** We modeled the two scenarios described in Table 8 – the MidAmerican Preferred
5 Plan and the Environmental Intervenor Preferred Plan. We also tested each
6 scenario under a low load sensitivity. For a detailed list of all assumptions in each
7 scenario beyond what I discuss here, see the Direct testimony of Chelsea Hotaling
8 – in particular, Table 2.

9 **Table 8. Scenarios Modeled by Energy Futures Group**

Scenario Name	Coal plant retirement dates	Wind PRIME Projects	Replacement Resources
MidAmerican Preferred Plan	Plants retire on dates given by MidAmerican	All Projects	Model may economically add new clean energy resources to meet load starting in 2030
Environmental Intervenor Preferred Plan	Optimized Economic Retirement of Louisa, Neal 3, and Ottumwa in 2025; retires Neal 4 in 2028, WSEC3 in 2031, WSEC 4 in 2034.	Roughly one third of Wind PRIME wind and 50 MW of solar. ⁵⁵	Model may economically add new clean energy resources to meet load starting in 2025

10

55

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 The MidAmerican Preferred Plan represents MidAmerican's plans as currently
 2 proposed in its updated Wind PRIME application. It includes the updated Wind
 3 PRIME project ([REDACTED] of wind in 2023 and [REDACTED] of wind and 50 MW of
 4 solar PV in 2024⁵⁶), continued operation of its coal plants until [REDACTED] for Neal 3,
 5 [REDACTED] for Louisa, Ottumwa, Walter Scott 3 and Neal 4, and [REDACTED] for Walter Scott
 6 4,⁵⁷ and new resource additions starting in 2030. We modeled this scenario to
 7 provide a baseline set of data on portfolio cost (net present value revenue
 8 requirement or NPVRR) and greenhouse gas emissions that we could compare to
 9 alternative portfolios. We allowed the model to build new resources starting in
 10 2030 [REDACTED].⁵⁸ MidAmerican filled
 11 unmet energy and capacity needs in its model with energy and capacity market
 12 purchases.⁵⁹ We maintained MidAmerican's retirement dates for all other existing
 13 resources, with the exception of Quad Cities, which Constellation announced it
 14 will relicense,⁶⁰ [REDACTED]

15 [REDACTED]
 16 The Environmental Intervenor Preferred Plan represents a reasonable alternative
 17 portfolio. We preserve around one third of the wind proposed in Wind PRIME
 18 and the solar PV. We preserved the solar PV because the Company currently has
 19 minimal solar resource deployed on its system, therefore this project adds to
 20 MidAmerican's resource diversity. [REDACTED]

21 [REDACTED]
 22 [REDACTED]

⁶⁰ Glick Exhibit 32, MidAmerican Response to Tech Customer DR 5.

⁶¹ Guyer Exhibit 2, MidAmerican Response to IBEC DR 01, Confidential Attachment.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 [REDACTED]
2 [REDACTED]
3 [REDACTED] The model was
4 allowed to determine economically when to retire some of the coal and when to
5 add new clean energy resources, starting in 2025. The purpose of this scenario is
6 to compare the greenhouse gas impacts and costs of a reasonable alternative
7 resource portfolio to MidAmerican's current portfolio. All other resource
8 assumptions were unchanged from MidAmerican Preferred Plan.

9 **Q Please explain the low load sensitivity that you test for all scenarios.**

10 **A** The lower load sensitivity captures the impact of two potential forces: the addition
11 of incremental cost-effective energy efficiency measures that decrease load, and
12 the possibility that new commercial/industrial demand does not materialize to the
13 extent that MidAmerican currently projects⁶² based on the potential defection of
14 large energy users that want to buy power from the open market.⁶³ We retained
15 the same retirement dates for the coal plants as in the base scenario and
16 reoptimized the new resource additions in both the MidAmerican Preferred Plan
17 and Environmental Intervenors Preferred Plan under the low load sensitivity.
18 Details of our forecast are discussed in the testimony of Chelsea Hotaling.

19 **Q What new resources did you allow the model to select?**

20 **A** We allowed the model to select from new wind, solar PV, 4-hour battery storage,
21 and 10-hour battery storage resources. We also offered a clean firm resource

⁶² Glick Exhibit 32, MidAmerican Response to Tech Customer DR 04a-Confidential Attachment 2022_2031 Electricity Forecasts, page 19.

⁶³ Donnelle Eller, "Big Iowa energy users say they want to buy power on open market, bypassing current providers." Des Moines Register, September 30, 2022. PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 starting in 2030 as a proxy for long duration storage. To reflect the passage of the
2 IRA, we modeled all new wind and solar PV resources as qualifying for 100
3 percent of the PTC (stepping down after 2033), and battery storage as qualifying
4 for 30 percent of the ITC. This matched MidAmerican's assumptions for the tax
5 credits that the wind and solar PV in Wind PRIME would qualify for following
6 passage of the IRA.

7 **Q How did you model MidAmerican's interactions with the MISO market?**

8 **A** We relied on MidAmerican's energy market price forecast with Wind PRIME for
9 both our MidAmerican Preferred Plan and Environmental Intervenors Preferred
10 Plan.⁶⁴ We utilized this forecast for both scenarios based on the Company's
11 acknowledgment that even if it didn't own Wind PRIME, the projects were likely
12 to be built in Iowa regardless.⁶⁵ I believe it more accurately represents future
13 market prices with an increasing penetration of renewables. We developed hourly
14 import and export limits based on MISO Zone 3 import and export limits from the
15 2022/2023 MISO Planning Resource Auction (PRA) results. We limited capacity
16 purchases to 100 MW, priced at CONE, and sales to 50 MW, priced based on
17 MidAmerican's price assumptions.⁶⁶

⁶⁴ Glick Exhibit 32, MidAmerican Response to Tech Customer DR 11, Confidential Attachment.

⁶⁵ See, Rebuttal Testimony of Company Witness Hammer, Pg. 14; Rebuttal Testimony of Company Witness Fehr, Pgs. 7-8; Direct Testimony of Company Witness Brown, Pg. 11.

⁶⁶ Glick Exhibit 32, MidAmerican Response to OCA DR 8a, AEO Attachment.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 **Q How did this modeling take into account the MISO seasonal construct?**

2 **A** Given the uncertainty in what the final MISO seasonal resource adequacy
3 construct will look like, we modeled MidAmerican with a single summer reserve
4 margin. MidAmerican's system is currently summer peaking.⁶⁷ We relied on
5 MidAmerica's own assumptions on firm capacity contribution for its clean energy
6 resources.⁶⁸ As discussed in greater depth in witness Hotaling's testimony, this
7 was the most reasonable approach given the current status of the MISO planning
8 process. Moreover, solar is expected to have the greatest change in capacity value,
9 and the model is selecting mostly battery storage in the near term. This should
10 allow MISO sufficient time to finalize its new capacity construct before
11 MidAmerican has to make decisions about larger additions of solar PV.

12 ***iv. Modeling results***

13 **Q What were the results of this modeling?**

14 In the Environmental Intervenors Preferred Plan, all coal is retired by 2034.
15 Specifically, the model found it was economic to retire Louisa, Ottumwa, and
16 Neal 3 in the first year it was allowed to do so, which is 2025. The Plan also
17 includes retirement of Neal 4 in 2028, Water Scott 3 in 2031, and Walter Scott 4
18 in 2034. As shown in Table 9 below, [REDACTED]

19 [REDACTED] Our finding that Louisa, Ottumwa and Neal 3
20 are the most uneconomic and therefore retire first [REDACTED]

21 [REDACTED]

Walter Scott 3		12/31/2031
Water Scott 4		12/31/2034

Source: Guyer Exhibit 2, MidAmerican Response to IBEC DR 01, Confidential Attachment.

The model also economically adds a mixture of 4-hour battery storage starting in 2025 (which it maxes out at our annual build limit of 500 MW in the first two years its allowed), Solar PV starting in 2030, and wind in 2033. This is in addition to roughly one third of the Wind PRIME wind and the 50 MW Wind PRIME solar project. Table 10 below shows the total resource additions and coal plant retirements in the Environmental Intervenors Preferred Plan.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

Total	2645	3700	750	149	(-2700)

Source: Direct testimony of Chelsea Hotaling at pg. 21.

Figure 1 below shows the change in total resource mix for MidAmerican's system under the Environmental Intervenors Preferred Plan. This shows the retirement of the Company's coal over the next decade, and the replacement of that capacity with battery storage, solar PV and eventually wind. The Company already relies on a substantial quantity of wind, but it is the incremental build out of battery storage and solar PV and retirement of coal that is most pronounced relative to the Company's current resource portfolio.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

Figure 1: Environmental Intervenor's Preferred Plan - Changes in total resource firm capacity (MW)

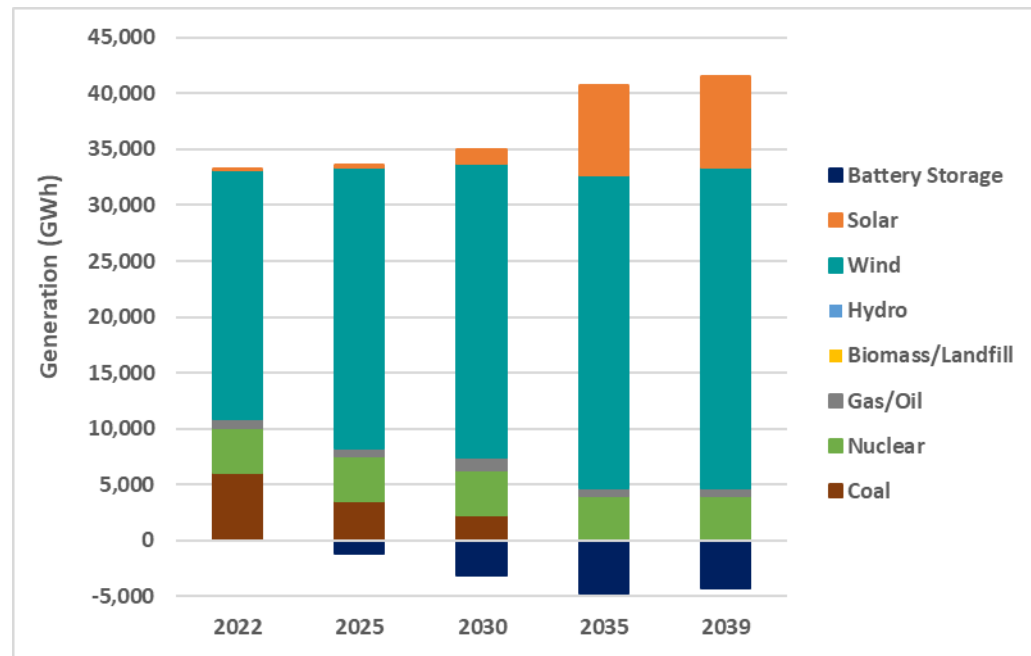

Source: Direct testimony of Chelsea Hotelling at pg. 19.

Figure 2 shows the projected generation mix for the Environmental Intervenor's Preferred Plan. MidAmerican currently relies on wind for most of its generation and this trend is expected to continue throughout the study period. But our modeling shows it is also economic to add a large quantity of solar PV to MidAmerican's system, especially after the model retires the last of MidAmerican's coal fleet in the 2030s. Throughout the study period, the model also builds and deploys a large quantity of battery storage. Battery storage provides substantial value to MidAmerican's system by managing curtailments of solar PV and wind (as I will discuss more below).

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

Figure 2: Environmental Intervenor Preferred Plan generation (GWh)

Source: Direct testimony of Chelsea Hotelling at pg. 20.

Q How did your results change under the low load sensitivity?

A Under the low load sensitivity, the model needed less capacity and therefore built out 200 MW less battery storage, 600 MW less solar PV and 650 MW less wind and made fewer capacity purchases (146 MW).

Q How do the results from the Environmental Intervenor Preferred Plan differ from what you found in the MidAmerican Preferred Plan?

A In the MidAmerican Preferred Plan, the model adds battery storage as soon as it is allowed in 2030. Based on preliminary unconstrained modeling runs we found that the model wanted to add battery storage immediately (in the 2020s) to reduce wind curtailments. But in our final runs we limited new resource builds [REDACTED] to avoid any perception that we were allowing the model to overbuild in the MidAmerican Preferred Plan to artificially inflate the plan costs. The model also adds solar PV

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

in the 2030s, but otherwise MidAmerican's resource mix looks much like it does today, with the addition of the Wind PRIME project (see the testimony of Chelsea Hotaling for additional results from the MidAmerican Preferred Plan). Under the low load sensitivity, the model adds slightly less battery storage (51 MW) and no new solar PV. MidAmerican does not actually plan to build these resources, but we needed to allow the model to address MidAmerican's forecasted capacity shortfall to create an "apples to apples" cost comparison between the plans.

Table 11: MidAmerican Preferred Plan Encompass Expansion Plan (MW)

Year	4-HR Battery Storage	Solar PV	Wind	Coal Retired
2030	125	0	0	0
2031	125	0	0	0
2032	125	0	0	0
2033	125	950	0	0
2034	250	0	0	0
2035	551	0	0	(558)
2036	0	0	0	0
2037	0	0	0	0
2038	0	0	0	0
2039	0	0	0	0

Source: Direct testimony of Chelsea Hotaling at pg. 21.

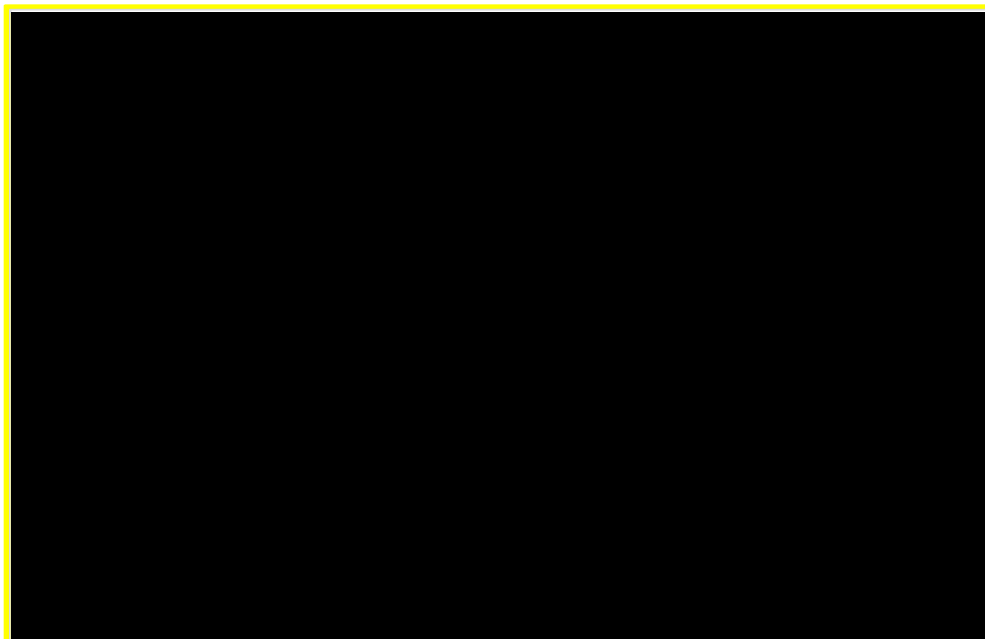

Q How do curtailment levels compare across the two plans?

A As shown in Figure 3 below, curtailments are very high under MidAmerican's Preferred Plan, and are projected to rise even more once Wind PRIME comes online. This is due, in part, to the absence of battery storage in MidAmerican's resource portfolio to store excess wind generation. Curtailment levels don't fall until the mid-2030s when battery storage resources are deployed. These battery storage resources are not ones that MidAmerican has indicated it plans to build, but rather are resources that the EnCompass model selected to reduce curtailments and fill projected load growth.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

In the Environmental Intervenors Preferred Plan, curtailments are much lower across the study period. This is because the model builds out battery storage immediately to manage curtailment and also builds out new wind and solar PV resources in a more incremental fashion over the next decades in the Environmental Intervenors Preferred Portfolio. Our modeling shows that this approach results in substantially lower levels of curtailment than under MidAmerican's current plan and will provide substantial benefit to MidAmerican's system.

Figure 3: Confidential Comparison of Annual levels of Curtailment (GWh)

Source: Direct testimony of Chelsea Hotaling at pg. 26; Exhibit 37, DG Confidential Workpaper 5.

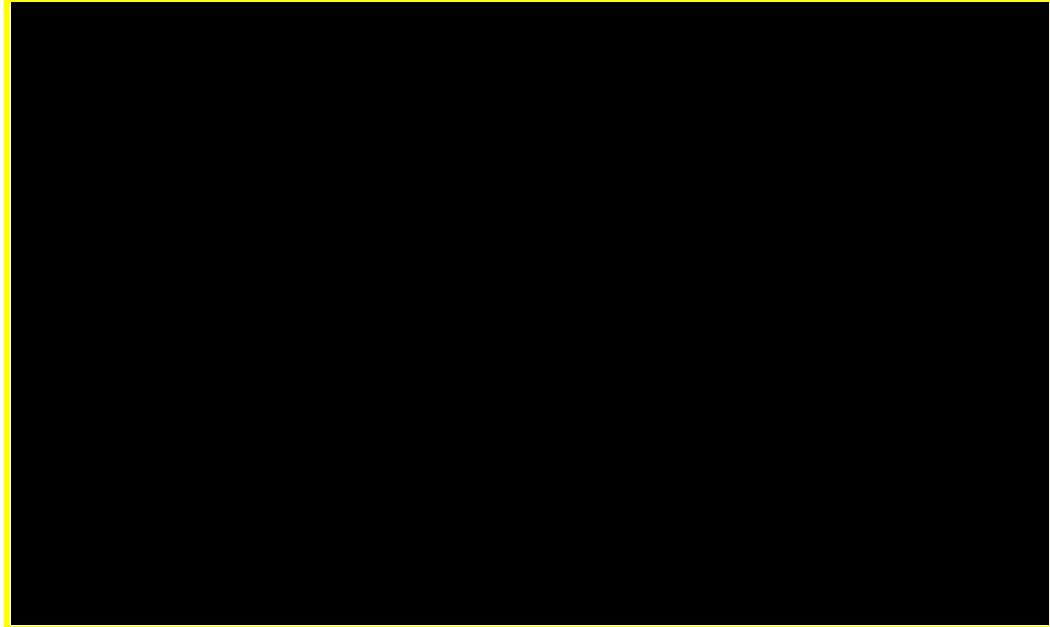

Q How do the coal units perform under the MidAmerican Preferred Plan?

A MidAmerican's coal units continue to operate through at least [REDACTED], but as shown in Figure 4 below, our modeling finds that their capacity factors [REDACTED] over time. Specifically, the projected capacity factors the coal units are expected to [REDACTED]

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 [REDACTED] as the Wind PRIME projects come online. After 2026, no unit operates
2 [REDACTED], and the fleet average capacity drops to [REDACTED]
3 percent between 2026 and the end of the study period in 2039.

4 **Figure 4: Confidential projected capacity factors for coal units in MidAmerican**
5 **Preferred Plan**

6
7 *Source: Developed based on data from the workpapers of Chelsea Hotaling; Exhibit 37, DG*
8 *Confidential Workpaper 5.*

9 **Q Is it reasonable for MidAmerican to expect its coal units can operate at such**
10 **low utilization?**

11 **A** No. These results are very concerning. With such low utilization, MidAmerican is
12 relying on its old coal plants to act as load-following super-peakers. Coal plants
13 are intended to operate as baseload units – that is, to always be online, and to
14 ramp slowly up and down, as needed to meet demand. Coal units are not intended
15 to be regularly switched on and off as peaking resources. They are costly and time
16 intensive to start up, shut down, and ramp up and down, and doing so increases
17 the wear-and-tear on the units.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 Additionally, coal units require large expenditures on fixed and capital costs to
 2 stay online. But as utilization falls, the units have less revenues to cover the same
 3 (or even higher) costs. Coal plants are also a poor choice to back-up wind
 4 resources – they do not respond quickly to changing resource output, and they are
 5 expensive when utilized so minimally. MidAmerican should not rely on them on
 6 simply because they are already there – instead the Company should evaluate the
 7 economics of continued reliance on these units, as their utilization falls, relative to
 8 alternatives.

9 **Q Environmental Intervenors’ Preferred Plan includes retiring 1,393 MW of**
 10 **coal in 2025. Are you claiming that your modeling shows that is it possible to**
 11 **retire 1,393 by 2025?**

12 **A** No. Our modeling shows that it is most economic for MidAmerican to retire
 13 Louisa, Ottumwa, and Neal 3 as soon as possible, and replace the energy and
 14 capacity with alternatives (specifically, battery storage and market energy). Our
 15 modeling didn’t contemplate the feasibility of retiring the units on that timeline,
 16 but it did show that for each year the plants stay online, the company is incurring
 17 unnecessary costs for ratepayers. 2025 was the soonest retirement date allowed,
 18 which is why that is the date selected by the model, but any near-term retirement
 19 will benefit MidAmerican ratepayers. This is in part because MidAmerican’s
 20 currently has a [REDACTED]. The Company’s own load and resource data⁶⁹
 21 shows that the Company can retire one uneconomic coal plant immediately and
 22 will not need to procure replacement capacity until [REDACTED] at the earliest, and
 23 more likely [REDACTED].

⁶⁹ Direct Testimony of Company Witness Hammer, Pg. 18, Table 3.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

Q How did the costs compare between MidAmerican's and the Environmental Intervenor Preferred Plan?

A The Environmental Intervenor Preferred Plan has a lower Net Present Value Revenue Requirement (NPVRR) (i.e., lower total cost) than the MidAmerican Preferred Plan by \$121 million in the base load sensitivity, and by \$157 million in the low load sensitivity, as shown in Table 12 below. This higher cost difference under the low load sensitivity means that if MidAmerican's aggressively high load growth projections do not materialize, the Company will be even better off with coal retirements and a clean energy portfolio of resources.

Table 12: NPV Results under base load and low load sensitivity 2022-2039 (\$000)

Plan	Total NPV	Delta
Base load		
Environmental Intervenor	\$4,851,288	-\$121,020
MidAmerican Preferred	\$4,972,308	
Low load sensitivity		
Environmental Intervenor	\$4,213,221	-\$157,415
MidAmerican Preferred	\$4,370,635	

Source: Direct testimony of Chelsea Hotelling at pg. 29.

Figure 5 below shows the change in projected spending at the Company's existing coal unit and on new resources in each scenario. Our modeling shows that spending on fuel, O&M, capital costs, as well as carbon costs at the Company's existing coal fleet is expected to fall by over \$1 billion in the Environmental Intervenor Preferred Plan as compared to MidAmerican's Preferred Plan. At the same time, spending on new battery storage, solar PV and wind resources, including in Wind PRIME, is expected to increase by just over three quarters of a billion dollars in the Environmental Intervenor Preferred Plan relative to the MidAmerican Preferred Plan. The remainder of the delta between scenarios is attributed mostly to change in sales and purchases revenues between scenarios (not shown here).

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 **Figure 5: AEO Confidential NPV broken down by cost category (\$000)**

2
3 *Source: Developed based on data from the workpapers of Chelsea Hotaling; Exhibit 40, DG AEO*
4 *Confidential Workpaper 7.*

5 **Q How did CO₂ emissions compare between MidAmerican's and the**
6 **Environmental Intervenors Preferred Plan?**

7 **A**As shown in Figure 6 below, the Environmental Intervenors Preferred Plan has
8 lower annual emissions than the MidAmerican Preferred Plan starting in 2026 as
9 the coal plants begin to retire. Emissions levels in the Environmental Intervenor
10 Plan plateau in the late 2020s, and then fall again in the early 2030s as even more
11 as coal units are retired. After 2035, when MidAmerican's last coal unit is retired,
12 emissions flatten out right above zero.

13 In the MidAmerican Preferred Plan, emissions levels decline when Wind PRIME
14 comes online in 2023 and 2024, but then gradually rise back up through the early

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 2030s. MidAmerican has no planned resource additions beyond 2030, so we show
2 no emissions projections for the MidAmerican Preferred Plan beyond 2030.⁷⁰

3 **Figure 6: Confidential CO₂ emission reduction relative to 2005 levels**

4
5 *Source: Exhibit 37, DG Confidential Workpaper 5.*

6 Over the study period (2022–2039), the Environmental Intervenors Preferred Plan
7 emits 25 million less tons of CO₂ than the MidAmerican Preferred Plan.

8 **Q Please summarize your findings.**

9 **A** We found that a combination of solar PV, wind, and 4-hour batter storage
10 provides a more reasonable, lower cost and lower emissions generation portfolio
11 than the Company's exiting plan to build out Wind PRIME and continue relying

⁷⁰ These results are all based on the assumption that the Company operates all its unit economically, rather than utilizing a must-run status to keep them online even at times when its uneconomic to do so. This means that our emissions projections for the MidAmerican Preferred Plan are a sort of best-case scenario projection. If MidAmerican operates any of its units with a must-run status moving forward, emissions levels will be larger than projected here.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 on its existing coal units for another two decades at least. Further, the
2 Environmental Intervenors Preferred portfolio is robust against lower load
3 projections and delivers additional incremental value over the MidAmerican
4 Preferred Portfolio if the Company's aggressive load forecast does not
5 materialize.

6 **6. MIDAMERICAN'S CLAIMS AROUND THE BENEFITS OF THE WIND PRIME**
7 **PORTFOLIO, BOTH ORIGINALLY AND AFTER THE PASSAGE OF THE IRA, ARE**
8 **MISLEADING AND UNSUPPORTED**

9 **Q What claims does MidAmerican make about the timeline of the updated**
10 **Wind PRIME portfolio?**

11 **A** MidAmerican claims that the Wind PRIME project should be built with the same
12 urgency as before, if not a higher urgency, despite extended tax credits.
13 Specifically, MidAmerican claims that: the IRA is increasing competition for
14 renewable sites and increasing costs; developers have higher leverage due to
15 increasing competition; and the sooner it builds the project, the more quickly
16 customers realize the benefits.⁷¹ These claims distract from the fact that
17 MidAmerican has not demonstrated that the project is reasonable relative to
18 alternatives.

⁷¹ Rebuttal Testimony of Company Witness Brown, Pg. 3; Rebuttal Testimony of Company Witness Fehr Pg. 18; Rebuttal Testimony of Company Witness Jablonski, Pg. 3.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 **Q** **What claims does MidAmerican make about the resource diversity benefits**
2 **of Wind PRIME?**

3 **A** MidAmerican claims that the resource diversity impacts of Wind PRIME should
4 be viewed within the context of MISO’s entire system, not just MidAmerican’s
5 system.⁷² Specifically, the company states: “While there is a significant amount of
6 wind energy in Iowa, broader regional market considerations are a critical frame
7 of reference. MidAmerican participates in a regional MISO market where it
8 receives benefits related to weather diversity and broader access to economic
9 energy for both purchases and sales.”⁷³ I agree with the Company that broader
10 market considerations are important and that the Company benefits from
11 participation in the MISO market. But market participation and reliance are only
12 one part of MidAmerican’s supply mix. And it is not reasonable to accept the
13 premise that the diversity of its resource mix is irrelevant because the Company is
14 part of a larger market. MidAmerican has an obligation to ensure its own resource
15 mix is reasonable relative to alternatives. Adding more wind without explicitly
16 considering the benefits of complementary additions of solar PV and battery
17 energy storage, and coal plant retirements to MidAmerican’s system does not
18 ensure the system is reasonable, reliable, or low cost; rather it perpetuates
19 MidAmerican’s reliance on a wind-coal system.

20 **Q** **Why are you concerned about MidAmerican creating a wind-and coal-heavy**
21 **system?**

22 **A** As I discussed above, coal plants are costly to operate and maintain. Moreover,
23 they are relatively inflexible as they cannot quickly respond to changing system
24 conditions (i.e., turn on and off, or ramp up and down quickly), and they are

⁷² Rebuttal Testimony of Company Witness Hammer, Pg. 9.

⁷³ Id.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 subject to both coal supply shortages and coal price uncertainty. Wind resource
 2 output is generally highest at night and in the winter, and lowest during the
 3 summer and daytime. Adding more wind to the system will increase output during
 4 the times when the Company already has ample wind output. It will also increase
 5 reliance on old legacy fossil units, which cannot ramp up or down quickly in
 6 response to either wind output changes or market changes, during times when
 7 wind output is lowest. If instead the Company considered solar PV and battery
 8 storage as complements to wind and – in total- as replacements for coal, it would
 9 mitigate some of these concerns.

10 The generation profile of solar PV complements the output of wind, with high
 11 summer and daytime output; and battery storage can store excess generation for
 12 times when wind and solar output is lower. This will produce a more reasonable,
 13 reliable, and lower cost system than the one MidAmerican is proposing. [REDACTED]

14 [REDACTED]
 15 [REDACTED]
 16 [REDACTED]
 17 [REDACTED]

18 **Q How did MidAmerican respond to your criticisms that the Company did not**
 19 **consider additional solar PV in Wind PRIME?**

20 **A** MidAmerican’s primary justification is that “the accredited capacity benefits for
 21 solar are limited in winter months and are likely to decrease in all seasons as solar
 22 penetration levels increase.”⁷⁵ Company witness Hammer also points out that
 23 solar PV capacity accreditation declines with increasing penetration.⁷⁶

⁷⁴ Confidential ZES, Pg. 14.

⁷⁵ Rebuttal Testimony of Company Witness Hammer, Pg. 3-4.

⁷⁶ Id. Pg. 16-19.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 **Q How do you respond to the Company’s concerns about low capacity**
2 **accreditation for solar PV in winter?**

3 **A**This is an interesting criticism given that MidAmerican itself states, “Wind
4 PRIME is primarily about providing affordable emission-free energy, rather than
5 providing high levels of accredited capacity value.”⁷⁷ Mr. Hammer is correct in
6 adding that “various resource types will be required as the energy transition
7 continues to add more emission-free resources. Some resources will have higher
8 capacity accreditation values [...], and some will have lower capacity
9 accreditation values.”⁷⁸ Likewise, solar can “provide other benefits in diversifying
10 the timing of renewable energy.”⁷⁹

11 This can be clearly seen in a comparison of the wind generation shapes and solar
12 generation shapes provided by the Company. During early July, for example,
13 when MidAmerican’s wind resources typically have very low capacity factors,
14 solar resources have a much more reliable generation shape with high daytime
15 capacity factors.⁸⁰ The diversity benefits of solar cannot be viewed in light of
16 accreditable capacity alone, given that an important energy balancing need in a
17 wind-heavy system occurs in the summer, when solar tends to perform best.
18 MidAmerican cannot rigorously examine those benefits to maximize the benefits
19 of solar through its nine-factor analysis. This requires capacity expansion
20 modeling. MidAmerican acknowledged both the [REDACTED]

8

Q How does MidAmerican defend the need to maintain its existing thermal resources, specifically its coal plants, as part of Wind PRIME?

9

10

A MidAmerican cites reliability needs⁸¹ and specifically cites two studies to make the point that MidAmerican's system needs more than just renewables: (1) a MISO RIIA study that makes a case for balancing resources, including

11

12

⁸¹ Confidential ZES, Pgs. 14-15.

⁸² Rebuttal Testimony of Company Witness Hammer, Pg. 7.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 conventional dispatchable resources;⁸³ and (2) a North American Reliability
2 Corporation (NERC) State of Reliability report that emphasizes the need for
3 balancing resources “for reliable integration of the growing fleet of variable
4 renewable energy resources.”⁸⁴

5 The Company goes on to claim that because Wind PRIME does not include the
6 retirement of any of its thermal assets, “there is no evidence that the Project will
7 reduce MidAmerican’s ability to meet customers’ reliability requirements.”⁸⁵ But
8 adding 2,042 MW of wind to the system to capture tax credits and ignoring how
9 those new resources will interact with the Company’s existing resources is not a
10 reasonable way to plan a system.

11 **Q How do you respond to MidAmerican’s claims that it needs its existing**
12 **resource for reliability reasons?**

13 **A** MidAmerican’s coal plants themselves cannot be assumed to be reliable,
14 particularly if MidAmerican intends to run them more and more as peaking plants
15 and less as baseload resources. Aging, coal-fired, steam generating units are not
16 good at balancing wind and renewables. As Hammer himself notes when he
17 quotes NERC, natural gas units—not coal units—are currently acting to balance
18 renewables, at least until they are supplanted by storage technologies.⁸⁶

⁸³ Id. Pg. 8-9. MISO RIIA study available at

⁸⁵ Rebuttal Testimony of Company Witness Hammer, Pg. 9.

⁸⁶ Id. Pg. 7.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 Coal plants take a long time to turn on and off and have long minimum up times
2 and minimum down times.⁸⁷ In a high-renewable grid, units with these
3 characteristics struggle to respond to changing market prices and changing
4 demand throughout the day. Thus, they become a liability. As MidAmerican's
5 modeling shows, its coal plants' capacity factors will [REDACTED] with
6 the addition of Wind PRIME,⁸⁸ and they will be required to run during very
7 specific market conditions to be economic and provide benefits to the grid. This is
8 a uniquely difficult task for old steam coal units to perform.

9 As MidAmerican's historical operations show, its coal plants have [REDACTED]
10 forced outage rates (Table 13). They also experience expensive, extended outages
11 for environmental retrofits, including a large 2022 scheduled outage at Louisa,
12 Walter Scott 3, and Ottumwa for ash pond retirements and wastewater treatment
13 facilities.⁸⁹ Indeed, if MidAmerican expects to run a group of decades-old coal
14 plants more variably and with increased ramping, these forced outage rates will
15 only go up, as will O&M costs. Likewise, the risk of future environmental
16 regulations between today and 2040 nearly guarantees additional scheduled
17 outages for environmental retrofits and maintenance.

4 **Q Did MidAmerican evaluate whether it would be reasonable to include other**
5 **firm resource alternatives, such as battery storage, in developing the Wind**
6 **PRIME portfolio?**

7 **A** No. While the Company asserts the need to study battery storage as part of the
8 Technology Study, MidAmerican failed to quantitatively evaluate whether battery
9 storage would be a reasonable resource addition. MidAmerican did not correct
10 this error even after storage became eligible for additional tax credits under the
11 IRA.⁹⁰

12 Battery storage can now replace coal as a firm capacity resource and is in many
13 ways better suited to the short-term grid balancing capabilities that a wind-heavy
14 portfolio calls for. As MidAmerican witness Fehr notes, “for certain energy
15 storage technologies, most notably lithium-ion batteries, the performance
16 characteristics of the technology are well known. It is also true that the technology
17 is commonly deployed as a grid-scale generation resource in areas with high

⁹⁰ Rebuttal Testimony of Company Witness Fehr, Pg. 14.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 levels of solar generation.”⁹¹ Put another way, battery storage can balance the
2 integration of high penetration of renewables and stabilize the grid.⁹²

3 Battery storage is already performing this role across the United States; installed
4 battery storage capacity more than tripled in 2021, growing from 1,438 MW in
5 2020 to 4,631 MW.⁹³ Much, much more is in interconnection queues. According
6 to a 2022 report by Lawrence Berkeley National Lab, more than 420,000 MW of
7 storage capacity were in interconnection queues nationwide in 2021.⁹⁴ Of that,
8 about half was “hybrid” storage paired with a specific type of generation. In Iowa
9 along, there is 2,800 MW of active battery storage projects active in the MISO
10 interconnection queue.⁹⁵

11 Witness Fehr rightly notes that it is more common for battery storage to be paired
12 with solar than with wind;⁹⁶ but as of 2021, wind plus storage projects in
13 interconnection queues totaled 14 GW—nearly 8 percent of all wind capacity in

⁹¹ Id. Pg. 13-14.

⁹⁶ Rebuttal Testimony of Company Witness Fehr, Pg. 13-14.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 queues nationwide queue.⁹⁷ Incidentally, 8 percent is also the fraction of proposed
2 hybrid wind that was in MISO’s interconnection queue.⁹⁸ Also, while it might be
3 true that 4-hourly lithium-ion battery storage is better suited to pair with solar,
4 long-duration battery storage is well suited to pair with wind.

5 **Q Do you have any closing thoughts?**

6 **A** Wind PRIME is not about decarbonization. As the company states, “providing
7 27/7 [sic] carbon-free electricity is not a stated goal of [W]ind [PRIME].”⁹⁹ Wind
8 PRIME’s purpose is to maximize revenues for MidAmerican, not to minimize
9 costs for ratepayers. Approving Wind PRIME as-is creates a wind-coal system
10 that does not provide 100 percent clean energy and instead keeps five coal units
11 running for 20 years or more, despite their advanced age, high costs, poor
12 suitability for a high-renewable grid, and the presence of cheaper alternatives.
13 According to the Company’s own modeling, Wind PRIME will [REDACTED]
14 reduce utilization of the Company’s aging coal plants. Specifically, MidAmerican
15 expects generation levels at its coal plants to drop [REDACTED]
16 [REDACTED].¹⁰¹ This is concerning
17 because it means the Company will be paying high fixed maintenance and capital

⁹⁷ Lawrence Berkeley National Laboratory, *Queued Up: Characteristics of Power Plants Seeking Transmission Interconnection As of the End of 2021*. April 2022. Page 18, available here https://emp.lbl.gov/sites/default/files/queued_up_2021_04-13-2022.pdf.

⁹⁸ According to the Lawrence Berkeley National Laboratory study referenced above, “hybrid” wind is nearly all “wind+storage,” though it also includes wind+solar and wind+solar+storage.

⁹⁹ Glick Exhibit 32, MidAmerican Response to EI DR 68 a.

¹⁰¹ Glick Exhibit 4, MidAmerican Response to Tech Customers DR 61(a), Confidential Attachment.

PUBLIC Supplemental Direct and Rebuttal Testimony of Devi Glick

1 costs to maintain plants that are minimally utilized and earn low energy market
2 revenues.

3 But there is an upside - thanks to new tax credits, MidAmerican projects the
4 undepreciated balance of the plants will be paid off faster. So even though Wind
5 PRIME (1) does currently rely on coal plants that are expected to become even
6 more uneconomic over time, and (2) does not plan for replacement of the coal
7 units, Wind PRIME is projected to make the coal plants easier to retire. Now
8 MidAmerican just has to take the steps to examine and plan for the early
9 retirement of its legacy fossil resources replacement with new resources to ensure
10 that the Company's portfolio creates the most value for ratepayers.

11 **Q Does this conclude your testimony?**

12 **A** Yes.
